Chapter 1 - Vision, Philosophy & Product Identity

1.1 Purpose

DragonHub is a basketball operations platform designed to centralize every part of a professional basketball organization's scouting and decision-making workflow.

DragonHub is **not** intended to compete with public basketball websites such as Eurobasket, RealGM, Flashscore or FIBA.

Those platforms provide public information.

DragonHub exists to organize **internal basketball intelligence**.

Its purpose is to help basketball staff make faster, more informed and more consistent decisions.

1.2 Mission

Every feature inside DragonHub should answer one question:

Does this help a basketball department make better decisions?

If the answer is no, the feature should either be redesigned or removed.

DragonHub intentionally avoids unnecessary complexity.

Every page should help the user complete one specific basketball task.

1.3 Product Philosophy

DragonHub is designed around **workflows**, not databases.

Traditional scouting software usually focuses on storing players.

DragonHub focuses on helping scouts move efficiently through the entire scouting process.

Instead of thinking

Player Database → Player

DragonHub thinks

Game → Observation → Player → Report → Watchlist → Review Queue → Shortlist → Recruitment Decision

Every module should support this workflow.

1.4 Core Principles

Principle 1

Write once.

Use everywhere.

The same observation should never be written twice.

Example

Tournament Workspace → Observation → Automatically appears inside

- Player Timeline

- Reports
- Player Profile
- Watchlist
- Review Queue

Principle 2

One source of truth

DragonHub should never duplicate information.

Every important object exists only once.

Examples

One Player → Player Registry

One Club → Club Registry

One Competition → Competition Registry

Every module references these objects.

Principle 3

Scouting first.

Statistics second.

Statistics support decisions.

Scouting creates decisions.

DragonHub's competitive advantage is **internal knowledge**, not public statistics.

If public statistics disappeared tomorrow, DragonHub would still retain its value because scouting notes, reports and evaluations remain unique.

Principle 4

Speed matters.

A scout should never wait for information.

Pages should load progressively.

Priority

1. Names
2. Structure
3. Photos
4. Statistics
5. Additional metadata

Users should always be able to begin working immediately.

Principle 5

Less UI.

More basketball.

DragonHub should avoid unnecessary visual elements.

Examples

Instead of

- many coloured chips

use

- one meaningful colour indicator.

Instead of

- developer status messages

show

- basketball information.

Every visual element must justify its existence.

1.5 Product Identity

DragonHub is not:

X Database software

X CRM

X Statistics website

X Live scores application

DragonHub is:

✓ Basketball Operations Platform

1.6 Primary Users

DragonHub supports multiple user roles.

Every role should see only the information required for its work.

Administrator

Complete access.

Responsible for:

- databases
- scouting
- reports
- user management
- settings
- club operations

Scout

Focuses on

- Events
- Tournament Workspace
- Game Notebook
- Reports
- Watchlist
- Review Queue
- Shortlist

Does not require administrative functionality.

Coach

Focuses on

- Calendar
- Games
- Rosters
- Reports

Limited access to scouting information.

Youth Coach

Focuses only on youth teams.

Should never see professional-only events or information.

Front Office

Focuses on

- Reports
- Watchlist
- Shortlist
- Recruitment

Minimal editing permissions.

1.7 DragonHub Modules

DragonHub consists of independent modules that together create one basketball workflow.

These modules are:

Dashboard

Calendar

Events

Reports

Game Notebook

Tournament Workspace

Pro Database

Youth Database

KZS Youth Stats

Watchlist

Review Queue

Shortlist

Scouting Matchup

Roster

People

Settings

User Guide

Every module has one clearly defined responsibility.

Modules should never duplicate each other's purpose.

1.8 Workflow Philosophy

DragonHub follows one primary scouting workflow.

Event → Game → Observation → Player Timeline → Report → Watchlist → Review Queue → Shortlist → Recruitment

Every module should move the user naturally to the next step.

The platform should never force users to manually duplicate work.

1.9 Public Data vs Internal Data

DragonHub separates public information from internal scouting.

Public information includes:

- schedules
- statistics
- standings
- rosters
- player profiles

Internal information includes:

- observations
- reports
- ratings
- recommendations
- projections
- watchlists
- scouting history

Public information supports the platform.

Internal information creates its value.

1.10 Long-term Vision

DragonHub should eventually become the central operating system used by a basketball club.

The user should never feel like they are moving between separate applications.

Instead,

everything should feel like one continuous workflow.

Eventually there should no longer be

DragonHub → Pro Database → Youth Database → KZS

There should simply be

DragonHub

where every module shares:

- design system
- player registry
- club registry
- competition registry

- reports
- timelines
- search
- permissions

The platform should scale without changing its philosophy.

New features should integrate into existing workflows rather than creating parallel systems.

End of Chapter 1

Approved Product Principles

1. Workflow before databases.
2. One source of truth.
3. Write once, reuse everywhere.
4. Basketball decisions before statistics.
5. Minimal UI, maximum clarity.
6. Fast progressive loading.
7. Every module has one purpose.
8. DragonHub is a Basketball Operations Platform, not a statistics website.

Chapter 2 - Core Architecture

2.1 Overview

DragonHub is built around a small number of core objects.

Everything inside the application references these objects.

Modules should **never own their own copies** of players, clubs or competitions.

Instead, every module references the same entity.

This ensures:

- no duplicate information
- automatic synchronization
- shared reports
- shared timelines
- easier maintenance

Core Architecture

Every module consumes information from the registries.

No module owns players or clubs.

2.2 Player Registry

Purpose

Every basketball player inside DragonHub exists exactly once.

Everything references PlayerID.

Never compare players by name.

Every player contains

PlayerID
Name
Aliases
Birth Date
Nationality
Position
Height
Weight
Handedness
Current ClubID
Current CompetitionID
Profile Photo
Career History
Reports
Timeline
Watchlist Status
Estimated Level
Statistics

Used by

Pro Database
Youth Database
KZS Youth Stats
Game Notebook
Tournament Workspace
Reports
Watchlist
Review Queue
Shortlist
Scouting Matchup
Dashboard
Search

Rules

Player names are never duplicated.
Every observation references PlayerID.
Changing club does not create another player.
Historical observations always remain attached.

2.3 Club Registry

Purpose

Every basketball organization exists exactly once.

Examples

BC Vienna

Vienna

Basketball Club Vienna → One ClubID

Every club contains

ClubID

Official Name

Aliases

Historical Names

Country

City

Logo

Website

Current Competition

Current Roster

Historical Rosters

Reports

Games

Events

Used by

Calendar

Events

Tournament Workspace

Game Notebook

Scouting Matchup

Pro Database

Youth Database

Dashboard

Matching Engine

Whenever importing clubs:

1.

Exact Match → Done

2.

Alias Match → Done

3.

Fuzzy Match → Admin confirmation → Remember forever

4.

Create New Club

Only if no existing match exists.

2.4 Competition Registry

Purpose

Every competition exists exactly once.

Examples

BKT EuroCup

EuroCup Basketball

EuroCup → One CompetitionID

Contains

CompetitionID

Official Name

Aliases

Country

Age Category

Level

Season

Logo

Website

Statistics Source

Fixtures Source

Used by

Calendar

Events

Tournament Workspace

Reports

Player Profiles

Club Profiles

2.5 Relationship Engine ★★★★★

This is the heart of DragonHub.

Objects should never exist independently.

Everything connects.

Example

Observation → Player → Club → Competition → Game → Event

One observation can reference:

Multiple players

One game

One tournament

One club

One report

Everything remains linked.

2.6 Timeline Engine

Every important action creates a timeline entry.

Examples

Player viewed

Report written

Tournament observation

Game notebook

Video report

Tryout

Club change

Competition change

Timeline becomes chronological history.

2.7 Statistics Engine

Purpose

Import statistics automatically.

DragonHub is not a live scores application.

Statistics should be reliable rather than real-time.

Refresh Policy

International tournaments

Daily

Major leagues

EuroLeague

EuroCup

ABA

BCL

ACB

LNB

BBL

Every 3-4 days

Other leagues

Weekly

Every statistics page displays

Source

Last Updated

Refresh Schedule

Manual Refresh (Admin)

2.8 Fixture Engine

Purpose

Provide fixtures where useful.

DragonHub should not track every player.

Only:

Club teams

Watchlist

Review Queue

Shortlist

Tournament players

Next Game appears only for players actively monitored.

2.9 Search Engine

One global search.

Searches:

Players

Clubs

Competitions

Reports

Games

Events

Tournaments

Users

Search should understand aliases.

Searching

Vienna

returns

BC Vienna.

2.10 Automatic Signals Engine

Signals are generated automatically.

Examples

Coming out of College

Rookie in Europe

First Overseas Season

Breakout Season

Watchlist

Top Prospect

High Upside

Signals should never be entered manually.

2.11 Data Sources

DragonHub distinguishes between:

Public Data

Internal Data

Public

Schedules

Statistics

Rosters

Player information

Club information

Competition information

Internal

Reports

Observations

Ratings

Recommendations

Watchlists

Estimated Levels

Timeline

Notes

Public data may change.

Internal data belongs to DragonHub forever.

2.12 Import Philosophy

Never import players manually.

Always import:

Competition → Teams → Club Registry → Roster → Players → Tournament Workspace

Everything should happen automatically whenever possible.

2.13 Single Source of Truth

Every module consumes the same objects.

Examples

Player Profile → Player Registry

Tournament Workspace → Player Registry

Club Registry

Competition Registry

Scouting Matchup → Player Registry

Club Registry

Reports → Player Registry

Competition Registry

No module stores duplicate entities.

2.14 Architecture Rules

Before implementing any new feature ask:

Does this already exist inside:

Player Registry

Club Registry

Competition Registry

Timeline Engine

Statistics Engine

Relationship Engine

If yes,

reuse it.

Never duplicate functionality.

End of Chapter 2

Approved Architecture Principles

- One PlayerID per player.
- One ClubID per basketball organization.
- One CompetitionID per competition.
- Everything connects through the Relationship Engine.
- Reports, notebooks and observations reference objects instead of free text.
- Import competitions first, then teams, then rosters, then players.
- Public data supports DragonHub; internal scouting data defines its value.

Chapter 3 - Dashboard

3.1 Purpose

The Dashboard is the operational control center of DragonHub.

It is the first screen every user sees after signing in.

The Dashboard is **not** a statistics page.

It is **not** a database.

It is **not** a reporting page.

Its purpose is to answer one question:

What requires my attention today?

Every widget on the Dashboard should contribute to answering that question.

If a widget does not help users prioritize their work, it should not be on the Dashboard.

3.2 Design Philosophy

The Dashboard should always feel:

- clean
- calm
- information-rich
- easy to scan

It should never overwhelm the user with information.

The user should understand the current state of club operations within five seconds.

3.3 Information Hierarchy

The Dashboard should follow this hierarchy.

Level 1

Immediate attention

- Next Game
- Week Overview

Level 2

Operational planning

- Upcoming Fixtures
- Our Teams
- Home Games

Level 3

Historical information

- Recent Results

Anything else belongs in another module.

3.4 Layout

The Dashboard uses a fixed two-column layout.

Next Game	Week Overview
Upcoming Fixtures	Our Teams
Recent Results	Home Games

The left column contains chronological information.

The right column contains summaries.

3.5 Next Game

Purpose

Show the single most important upcoming club game.

Display:

Opponent

Competition

Date

Time

Venue

Logos

Game Status

Click → [Game Overview](#)

3.6 Week Overview

Purpose

Provide context for the selected week.

Display

Week Number

Date Range

Total Games

Home Games

Away Games

Neutral Games

Week Navigation

The Dashboard is state-based.

Selecting another week changes:

Upcoming Fixtures

Our Teams

Home Games

Recent Results (where appropriate)

Everything always represents one selected week.

Examples

Week 43 → Week 44 → Week 45

Never continue displaying

"This Week"

when another week is selected.

3.7 Upcoming Fixtures

Purpose

Show chronological upcoming games.

Display

Opponent

Competition

Date

Time

Venue

Status

Logo

Click → Game Overview

3.8 Our Teams

Purpose

Provide a quick summary of club activity.

Display

Team Name

Number of Games

Example

First Team	2
U20	1
U18	3
U16	2

Interaction

Clicking

Team Name → Filters Dashboard

Clicking

Number of Games → Opens popup

Example

Week 43

First Team

Wednesday

vs Krka

Saturday

vs Partizan

This should never trigger a Dashboard filter.

Numbers explain.

Names navigate.

3.9 Home Games

Purpose

Quick overview of games taking place at home.

Display

Opponent

Competition

Date

Time

Venue

[Click → Game Overview](#)

3.10 Recent Results

Purpose

Provide context for recent club performance.

Display

Opponent

Competition

Score

Status

[Click → Game Overview](#)

3.11 Dashboard Rules

Dashboard displays

Club information only.

Never scouting events.

Never tournaments.

Never external games.

Those belong inside Events.

3.12 Performance

Dashboard must feel instant.

Priority

[Dashboard Structure](#) → [Fixture List](#) → [Logos](#) → [Additional Metadata](#)

Never wait for everything before rendering.

3.13 Logos

Logos are loaded from local cache.

Never request logos directly from external sources during rendering.

Reserve logo dimensions before images load.

Never shift layout.

3.14 Color Philosophy

Dashboard uses minimal color.

Colors represent
teams.

Not decoration.

Current solution

Vertical team color indicators → Approved.

Do not return to colored badges.

3.15 Interaction Philosophy

Dashboard follows one interaction rule.

Clicking text → Navigate

Clicking numbers → Explain

Examples

Our Teams → Filter

2 Games → Popup

Reports → Open report

24 Reports → Show report list

3.16 Widgets that should NOT exist

Remove

Developer information.

Examples

Sync status

Internal loading messages

Debug information

Technical metadata

Example

"KZS rosters · 134 team registrations · checked..."

These belong inside

Settings → Integrations

Not the Dashboard.

3.17 Mobile

Dashboard should remain

two-column

on iPad.

Phone → single-column.

Cards should preserve the same hierarchy.

3.18 Future

Future Dashboard widgets

may include

Scouting Priorities

Watchlist Activity

Review Queue

Pending Reports

Only if they directly help prioritize today's work.

3.19 Success Criteria

A user opening DragonHub should know within five seconds:

- What is the next important game?
- How busy is this week?
- Which teams are playing?
- Which games are at home?
- What happened recently?

Without opening another module.

End of Chapter 3

Approved Dashboard Principles

- Dashboard is the operational control center.
- One selected week controls the entire page.
- Clicking names navigates.
- Clicking numbers opens contextual details.
- Dashboard contains only club operations.
- External scouting belongs to Events.
- Progressive loading only.
- Minimal color.
- Team colors are the primary visual identifier.
- No developer information visible to users.

Note for Claude / Codex

The Dashboard design is considered **feature complete**.

Future work should focus on:

- performance,
- consistency,
- bug fixes,
- progressive loading,
- week context,
- interaction polish.

Avoid introducing new widgets unless they directly improve daily decision-making. The Dashboard should remain clean and focused rather than becoming an information dump.

Chapter 4 - Calendar

4.1 Purpose

The Calendar is the operational schedule of the basketball club.

It exists to answer one question:

When are our teams playing?

The Calendar is **not** a scouting calendar.

It should never become a place where tournaments, showcases or external scouting events compete with club operations.

The Calendar is the internal operational planner of the organization.

4.2 Product Philosophy

DragonHub intentionally separates

Club Operations

from

Scouting Operations.

Many basketball applications mix both into one calendar.

DragonHub does not.

The separation is intentional because they answer different questions.

Calendar → "When are OUR teams playing?"

Events → "Where should we scout?"

Both modules remain focused because their responsibilities never overlap.

4.3 Scope

The Calendar contains only:

- Club games
- Club tournaments
- Internal club events
- Future club activities

Optional future additions

- Practices
- Travel
- Team meetings

Only if the club decides to manage those inside DragonHub.

4.4 What does NOT belong in Calendar

The following must always remain inside the Events module:

- External tournaments
- Showcases

- Basketball camps
- Tryouts
- Neutral scouting games
- Scouting trips
- National team events

This separation must never be removed.

4.5 Calendar Views

DragonHub supports several calendar views.

Every view uses exactly the same data.

Only the presentation changes.

Monthly View

Purpose

Season planning.

This is the default view.

Shows:

- Every club fixture
- Monthly statistics
- Quick navigation
- Upcoming games

Weekly View

Purpose

Operational planning.

Provides more vertical space.

Ideal for coaching staff.

Daily View

Purpose

Matchday management.

Shows:

- Today's games
- Game Overview
- Quick actions

Agenda View

Purpose

Travel planning.

Displays all activities chronologically.

Useful before tournaments.

List View

Purpose

Searching and exporting.

Supports sorting and filtering.

4.6 Layout

Monthly View remains the primary calendar.

Structure

Month Header → Statistics → Filters → Calendar Grid → Upcoming Games

The calendar itself always remains the primary visual element.

4.7 Month Statistics

Display

Games

Home

Away

Neutral

These values describe the currently displayed month.

Statistics should be compact.

Never dominate the page.

4.8 Team Identification

Approved solution:

Every game card uses a thin vertical line coloured according to the team.

This replaces the previous coloured badges.

Reasons:

- Cleaner
- Less visual noise
- Better on mobile
- Consistent with Dashboard

Hovering the line displays the team name.

No coloured abbreviations should be shown.

4.9 Team Legend

The legend above the calendar is interactive.

Every team colour represents a filter.

Click → Enable / Disable team.

Support multiple selections.

Example

First Team

U20

U18

U16

The legend replaces the old Teams dropdown.

4.10 Filters

Current filters:

Competitions

Show Club Events

Search

Team Legend

The old Team dropdown should be removed.

The legend already performs this function.

4.11 Game Cards

Each game card displays:

Opponent

Time or Result

Status

Vertical Team Indicator

No additional coloured badges.

The opponent should always be the most prominent text.

4.12 Game Overview

Selecting a game always opens the Game Overview.

Never another page.

Game Overview becomes the hub for:

Overview

Statistics

Reports

Quick Observations

Notebook

Everything related to one game.

4.13 Performance

Calendar must render immediately.

Priority

Calendar structure → Game cards → Logos → Additional metadata

No visible rebuilding.

4.14 Navigation

Previous Month

Next Month

Today

Month

Week

Day

Agenda

List

Everything remains accessible within one click.

4.15 Responsive Behaviour

Desktop

Full layout.

iPad

Desktop layout preserved.

Phone

Single-column.

No duplicated controls.

4.16 Interaction Rules

Calendar follows the same interaction philosophy as Dashboard.

Text → Navigate

Numbers → Explain

Game → Game Overview

Team → Filter

Legend → Filter

4.17 Future Improvements

Possible future additions

Weather

Travel

Arena information

Availability

Only if they support club operations.

Do not clutter the Calendar.

4.18 Must Never Change

The following principles are permanent:

- Calendar only contains club operations.
- External scouting belongs inside Events.

- Monthly View remains the default.
- Vertical team colour indicators replace coloured badges.
- Team legend acts as the team filter.
- Team dropdown must not return.
- Calendar prioritizes clarity over decoration.
- The opponent remains the primary visual focus of every game card.

4.19 Success Criteria

A user opening Calendar should immediately know:

- Which teams are playing.
- When they are playing.
- Whether the game is home or away.
- How busy the month is.
- Which game should be opened next.

Without opening any other module.

End of Chapter 4

Approved Calendar Principles

- Calendar = Club Operations.
- Events = External Scouting.
- Vertical team colour indicators are the permanent solution.
- Team legend replaces the Team dropdown.
- Game Overview is opened from every game.
- Performance and readability are more important than visual decoration.
- The Calendar must remain calm, predictable and easy to scan.

Product Note

One of the strongest product decisions in DragonHub is the separation between **Calendar** and **Events**. This distinction must be protected in future development.

Calendar answers:

"What are our teams doing?"

Events answers:

"Where should we scout?"

Keeping those responsibilities separate prevents the application from becoming cluttered and allows both modules to evolve independently while remaining easy to use. This principle should be considered a core part of DragonHub's identity.

Chapter 5 - Events

5.1 Purpose

The Events module is the scouting planning center of DragonHub.

It answers one question:

Where should we scout?

Unlike Calendar, Events is completely independent from club operations.

Events should help scouts organize future opportunities rather than club activities.

5.2 Philosophy

DragonHub intentionally separates:

Club Operations → Calendar

from

Scouting Operations → Events

This separation should never disappear.

The purpose of Events is not scheduling club games.

Its purpose is helping scouts discover, prepare and document scouting opportunities.

5.3 What is an Event?

Every Event represents one basketball opportunity.

Examples

International Tournament

National Championship

Club Tournament

Showcase

Camp

Tryout

Scouting Game

Friendly Tournament

National Team Tournament

Summer League

5.4 Event Lifecycle

Every event follows the same lifecycle.

Create Event → Import Competition → Import Teams → Club Registry → Current Rosters → Tournament

Workspace → Player Reports → Player Timeline

Every event should naturally move to the next step.

5.5 Event Layout

Structure

Summary Cards → Search → Filters → Event List → Selected Event → Tournament Workspace

The Event List remains the primary navigation.

Tournament Workspace becomes the working environment.

5.6 Summary Cards

Display

Upcoming

Live

Completed

Tryouts

Camp

Scouting Games

Small.

Compact.

Not visually dominant.

5.7 Search

Search should support:

Tournament Name

Competition

Country

City

Team

Player

Club

Aliases

Searching

Vienna → BC Vienna

Searching

EYBL → All EYBL tournaments.

5.8 Filters

Replace large dropdowns with searchable selectors.

Supported filters

Competition

Country

Age Category

Type

Status

Date

Club

Search should always be preferred over scrolling.

5.9 Event Cards

Every event displays

Tournament Name

Dates

Country

Venue

Age Category

Competition Type

Status

Number of Teams

Number of Games

Logo

Everything required to decide whether the event deserves attention.

5.10 Chips

Metadata chips should remain compact.

Examples

Pro

U18

Club Tournament

Scouting

Online

Do not use oversized badges.

Group chips logically.

Example

[U18] [Club Tournament]

[Scouting] [Online]

5.11 Sorting

Replace

Newest

Oldest

with

Upcoming First

Latest First

Recently Added

Country

Priority

Alphabetical

Sorting should match scouting workflow rather than database terminology.

5.12 Team Import ★★★★★

This becomes one of the core workflows.

Current

Tournament → Manually search players

New

Tournament → Import Teams → Club Registry → Current Rosters → Tournament Workspace

No manual player importing.

5.13 Club Registry Integration

Every imported team must reference Club Registry.

Never compare names.

Import

BC Vienna → Club Registry → Current Roster → Players

Ready.

5.14 Missing Clubs

If no club match exists

Display

Club not found

Search Registry

Create New Club

Never silently fail.

5.15 Tournament Workspace Integration

Selecting

Open Tournament

always opens

Tournament Workspace.

Never a plain report.

Tournament Workspace becomes the operational center.

5.16 Player Import

Players should never be imported manually.

Workflow

Tournament → Teams → Club Registry → Roster → Players → Observations

5.17 Tournament Workspace Connection

Every imported player becomes immediately available for:

Selection

Tagging

Reports

Timeline

Autocomplete searches only players currently participating in the tournament.

Never search the entire database.

5.18 Event Status

Suggested statuses

Upcoming

Live

Completed

Cancelled

Archived

These statuses should remain subtle.

No excessive colours.

5.19 Performance

Opening Events → Load event list → Load logos → Load metadata → Load Tournament Workspace

Do not block rendering waiting for all information.

5.20 Future

Future integrations

Official schedules

Official standings

Official statistics

Video links

Livestreams

Travel information

Only when useful for scouting.

5.21 Must Never Change

Events are not Calendar.

Events are not Reports.

Events are not Tournament Workspace.

Events organize opportunities.

Tournament Workspace documents observations.
 Reports summarize conclusions.
 Calendar manages club operations.
 These responsibilities must always remain separate.

5.22 Success Criteria

A scout opening Events should immediately know:

- Which tournaments are worth following.
- Which ones are currently active.
- Which teams are participating.
- Which players are available.
- How to begin scouting with one click.

No manual searching should be required once teams are connected.

End of Chapter 5

Approved Events Principles

- Events manage scouting opportunities.
- Calendar manages club operations.
- Teams are imported before players.
- Players come automatically from Club Registry.
- Tournament Workspace opens directly from every event.
- Search replaces large dropdowns.
- Event cards remain clean and compact.
- Chips are small metadata indicators, not dominant UI elements.
- Events never become a second Calendar.

Product Note

The **Events module is the entry point into the entire scouting workflow.**

It should not stop at showing tournament information.

Its responsibility is to prepare everything required before scouting begins.

The ideal workflow is:

1. Open Event.
2. Teams are already linked.
3. Rosters are already loaded.
4. Tournament Workspace is ready.
5. Start writing observations immediately.

The user should never manually search for players after importing teams. That work should already have been completed by the **Club Registry** and **Roster Linking** systems. This is one of the defining workflow advantages of DragonHub and should be treated as a core product principle rather than an optional feature.

Chapter 6 - Tournament Workspace

6.1 Purpose

Tournament Workspace is the operational scouting environment for basketball tournaments.

It replaces the traditional Tournament Report.

Instead of creating one large document, Tournament Workspace organizes observations around **players**.

Its purpose is to answer one question:

Which players did I discover during this tournament?

6.2 Philosophy

Traditional scouting software stores tournament observations inside one report.

DragonHub does not.

DragonHub stores:

Tournament → Teams → Players → Observations → Reports → Player Timeline

This allows every observation to become immediately reusable.

6.3 Primary Workflow

Create Tournament → Import Teams → Club Registry → Current Rosters → Tournament Workspace → Observe Players → Player Timeline → Player Reports → Watchlist → Review Queue → Shortlist

Every step should happen naturally.

6.4 Layout

The Tournament Workspace follows a three-column layout.

-----	Teams / Players → Roster Navigation
-----	Player Workspace → Observations Summary Tags
Attachments -----	Tournament Information Statistics Games
Quick Actions -----	

The Player Workspace always receives the largest amount of space.

6.5 Left Sidebar

Purpose

Roster management.

Display

Tournament Teams → Current Rosters → Players

Grouped by team.

Example

▼ Bakken Bears
Walker
Grant
Pedersen

▼ BC Kalev
 Koivisto
 Aalto
 ...

6.6 Team Import

The user imports teams.

Never players.

Workflow

Tournament → Import Teams → Club Registry → Current Roster → Players become immediately available.

6.7 Club Registry Integration ★★★★★

Tournament Workspace never owns players.

Everything comes from Club Registry.

Example

Import

BC Vienna → Club Registry → Current 2026/27 roster → Tournament Workspace

No manual work.

6.8 Missing Club

If no club exists

Display

Height

Birth Year

Current Club

Automatic Signals

Estimated Level

Follow

Observation Editor

6.10 Observation Editor

Observations should remain simple.

No timestamps.

No play-by-play logging.

Purpose

Basketball evaluation.

Example

Excellent frame.
Runs the floor well.
Still raw offensively.
Needs stronger left hand.

Exactly like a scout's notebook.

6.11 Player Tagging

Player tagging should work exactly like Game Notebook.

Typing

@ → Search only players participating in the tournament.

Never search the whole database.

Example

@Pedersen

Autocomplete → Sylvester Pedersen

Bakken Bears

Current tournament

6.12 Automatic Linking

Every observation automatically references

PlayerID

TournamentID

ClubID

CompetitionID

The observation immediately appears inside

Player Timeline.

No manual linking.

6.13 Profile Photos

Always display

Database Profile Photo.

Fallback → Player initials.

Never display both simultaneously.

6.14 Observation Cards

Every observation becomes its own object.

Contains

Date

Player

Observation

First Overseas Season

Breakout Season

Watchlist

Top Prospect

Signals should be automatic.

Never manually entered.

6.18 Tournament Summary

At any moment

Display

Players Mentioned

Top Prospects

Reports Created

Watchlist

Shortlist

Everything updates automatically.

6.19 Generate Player Reports

At tournament completion

DragonHub offers

Generate Player Reports
(6)

Creates draft reports using tournament observations.

No copy-pasting.

6.20 Timeline

Every observation automatically creates

Player Timeline

Entries.

Example

FIBA U16 → Tournament Observation → Player Report → Watchlist

Everything remains chronological.

6.21 Performance

Priority

Tournament Header → Roster → Player Workspace → Photos → Statistics → Reports

Never block rendering waiting for profile images.

6.22 Must Never Change

Tournament Workspace is not a report editor.

It is a player evaluation workspace.

Players remain the center of the interface.

Teams support navigation.

Tournament information supports context.

Reports summarize conclusions.

Observations always belong to players.

The user should never manually import players after teams have been imported.

6.23 Success Criteria

A scout attending a tournament should be able to:

Import teams. → Automatically receive rosters. → Select players. → Write observations. → Generate reports. → Update player timelines.

Without duplicating information.

Everything should happen inside one workspace.

End of Chapter 6

Approved Tournament Workspace Principles

- Teams are imported, never individual players.
- Club Registry automatically provides current rosters.
- Player Workspace remains the largest panel.
- Observations belong to players, not documents.
- Player tagging searches only the current tournament roster.
- Database profile photos always take priority.
- Estimated Level and Follow remain separate concepts.
- Generate Player Reports directly from tournament observations.
- Tournament Workspace replaces the traditional tournament report.

Product Note

Tournament Workspace is one of DragonHub's defining features.

Unlike traditional scouting software, it does not ask the scout to produce a large tournament document.

Instead, it asks:

"Which players did you observe, and what did you learn about each of them?"

Everything else - reports, timelines, watchlists and recruitment - should grow naturally from those player observations.

This module should always optimize for **speed of observation**, **minimal duplicate work**, and **automatic knowledge reuse**. It is intended to become the bridge between **Events**, **Game Notebook**, **Reports**, **Player Profiles**, **Watchlist**, and **Review Queue**, making it one of the central workflows of the entire DragonHub ecosystem.

Chapter 7 - Game Notebook

7.1 Purpose

Game Notebook is DragonHub's primary live scouting workspace.

It exists for one purpose:

Watch basketball and write high-quality scouting observations as quickly as possible.

Game Notebook is **not** a report.

It is **not** a statistics page.

It is **not** a player profile.

It is a digital scouting notebook.

7.2 Philosophy

Game Notebook should feel like writing inside a physical notebook while watching a game.

Everything should reduce friction.

Nothing should distract from observing basketball.

The page should always prioritize:

Basketball → Observation → Player

Everything else is secondary.

7.3 Primary Workflow

Open Game → Select Player → Observe → Write Note → Save → Player Timeline updates automatically → Report generated later

Game Notebook is where observations begin.

Reports summarize them later.

7.4 Layout

Three-column layout.

```
----- Home Team → Roster
----- Selected Player → Observations → Notes
----- Away Team → Roster
-----
```

The center column must always be the largest.

Never reduce it.

7.5 Left Column

Purpose

Navigate home team players.

Contains

Search

Position Filter

Roster

Team Notes

Current Player Highlight

Nothing else.

7.6 Right Column

Identical to the left.

Purpose

Navigate away team players.

Should never become a statistics sidebar.

7.7 Center Workspace

This is the core of DragonHub.

Contains

Compact Player Header → Automatic Signals → Category Chips → Observation Editor → Observation History

The user spends almost all of the game inside this panel.

7.8 Player Header

Display

Profile Photo

Name

Position

Nationality

Height

Weight

Birth Year

Club

Dominant Hand

Estimated Level

Follow Status

Automatic Signals

Keep compact.

Never consume unnecessary vertical space.

7.9 Observation Categories

Approved categories

Offense

Defense

Athleticism

Shooting

Playmaking

Rebounding

Character

IQ

Projection

General

Categories help organize observations.

They should never interrupt writing.

7.10 Notes

Notes remain intentionally simple.

Example

Excellent transition pace.
Needs stronger left hand.
Reads weak side well.
Competes every possession.

No timestamps.

No possession logging.

No play-by-play.

The purpose is player evaluation.

7.11 Player Selection

Selecting another player immediately changes the center workspace.

No loading screens.

No page reloads.

The user should be able to scout:

Home → Away → Home → Away

without interruption.

7.12 Automatic Player Linking

Every observation references

PlayerID

ClubID

CompetitionID

GameID

Timeline updates automatically.

7.13 Search

Player search only searches

Current Game.

Never the entire database.

7.14 Stats

Statistics are secondary.

Display only through

[Statistics] Stats

Click → Slide-out drawer.

Do not permanently reduce note-taking space.

7.15 Reports

Reports also open through

Drawer.

Never permanent.

7.16 Keyboard Workflow

Game Notebook must be fully usable from a keyboard.

Examples

Ctrl + →

Next Player

Ctrl + ←

Previous Player

Ctrl + O

Offense

Ctrl + D

Defense

Ctrl + A

Athleticism

Ctrl + S

Save

Ctrl + Enter

New Observation

The keyboard workflow is a core feature.

7.17 Team Notes

Every team supports its own notebook.

Example

Salon Vilpas

Switch aggressively.

Excellent spacing.

Weak transition defense.

BC Kalev

Very physical guards.
Poor FT shooting.
Strong offensive rebounding.

Team Notes remain independent from Player Notes.

7.18 Automatic Signals

Display

Coming out of College

Rookie in Europe

First Overseas Season

Watchlist

Breakout Season

Top Prospect

Signals appear automatically.

Never entered manually.

7.19 Performance

Priority

Player Name → Observation Editor → Profile Photo → Statistics → Reports

The user should never wait before writing.

7.20 Mobile

Desktop

Three columns.

iPad

Three columns.

Phone

Simplified player navigation.

Center notebook remains primary.

7.21 Must Never Change

The following principles are permanent.

The center note-taking workspace always remains the largest part of the page.

Scouting Matchup and Game Notebook exist to support live observation.

Statistics remain secondary.

Reports remain secondary.

Player selection must be instant.

No timestamps.

No play-by-play.

Game Notebook evaluates players.

It does not analyze tactics.

7.22 Success Criteria

During a live game a scout should be able to

Open player → Write observation → Switch player → Continue writing

without losing focus.

Everything else should stay out of the way.

End of Chapter 7

Approved Game Notebook Principles

- Three-column layout.
- Center workspace is sacred.
- Notes first.
- Statistics second.
- Reports third.
- Team rosters permanently visible.
- No timestamps.
- Keyboard-first workflow.
- Automatic timeline updates.
- Team Notes remain separate from Player Notes.
- Game Notebook remains a live scouting tool rather than a report editor.

Product Note

Game Notebook is one of DragonHub's defining modules.

Unlike traditional scouting software, it is not designed around creating reports.

It is designed around **capturing observations with as little friction as possible**.

Every design decision should therefore answer one question:

Will this help a scout observe basketball more effectively during a live game?

If the answer is no, the feature should probably belong somewhere else (Player Profile, Reports or Statistics).

This principle should remain unchanged throughout the lifetime of DragonHub.

Chapter 8 - Reports & Knowledge Base

8.1 Purpose

The Reports module is DragonHub's permanent basketball knowledge base.

It answers one question:

What do we already know about this player, team or event?

Reports are not temporary notes.

They are structured scouting knowledge that should remain valuable years after being written.

Every report should contribute to the club's long-term scouting memory.

8.2 Philosophy

DragonHub separates:

Observation → Game Notebook

Tournament Workspace → from

Knowledge → Reports

The user should never write the same observation twice.

Game Notebook and Tournament Workspace capture observations.

Reports summarize conclusions.

8.3 Report Types

DragonHub supports multiple report types.

Player Report

Complete scouting evaluation of one player.

Tournament Report

Generated from Tournament Workspace.

Focuses on the tournament as a whole while linking individual player observations.

Game Report

Overall evaluation of one game.

Tryout Report

Evaluation of players observed during a tryout.

Supports linking multiple players to one report.

Video Report

Scouting performed from recorded games.

Custom Report

Reserved for future use.

8.4 Knowledge Philosophy

Reports should not exist in isolation.

Every report can relate to:

- One or more Players
- One Club
- One Competition
- One Tournament
- One Game
- One Event

Everything should be connected through the Relationship Engine.

8.5 Report Layout

Reports consist of two areas.

Left

Report Browser

- Search
- Filters
- Collections
- Favorites
- Drafts

Right

Selected Report

The report content always remains the focus.

8.6 Search

Search should include:

Player names

Club names

Competitions

Tournament names

Report text

Tags

Author

Date

Searching

"Cameron Houindo"

should immediately return

- Player Report
- Tryout Report
- Tournament Report

- Video Report

without the user needing to know where the report was originally created.

8.7 Collections

Collections group reports.

Examples

EuroBasket U16 2026 → contains

- Player Reports
- Tournament Report
- Game Reports
- Video Reports

Collections never duplicate reports.

They simply organize them.

8.8 Report Relationships

Every report references objects instead of plain text.

PlayerID

ClubID

CompetitionID

TournamentID

GameID

This allows DragonHub to automatically surface reports in the correct player profile, tournament, club or competition.

8.9 Drafts

Reports can remain as Drafts until completed.

Draft reports are clearly separated from finished reports.

Drafts support collaboration but are not considered part of the permanent knowledge base until published.

8.10 Player Linking ★★★★★

Reports should support linking one or multiple players.

Examples:

- Tryout Report → multiple players
- Tournament Report → many players
- Player Report → one player

If the report title or metadata already identifies a player, DragonHub should suggest the link automatically.

Example:

"Cameron Houindo Tryout Report"

↓

[Suggestion] **Link to Cameron Houindo?**

8.11 Report Timeline

Every report automatically creates an entry in the Player Timeline (and other linked entities).

Reports are never copied.

They are referenced.

8.12 Must Never Change

- Reports are the club's permanent knowledge base.
- Observations are written once and reused.
- Reports always link to players, clubs, competitions and events through IDs.
- Collections organize reports - they never duplicate them.
- Search must always work across every report type.

8.13 Success Criteria

A scout should be able to search for a player years later and instantly find:

- every report,
- every tournament observation,
- every game note,
- every tryout,
- every video report,

without remembering where that information was originally created.

Chapter 9 - Scouting Matchup (EuroScout)

9.1 Purpose

Scouting Matchup is the primary live scouting workspace for professional basketball.

It exists to answer one question:

How quickly can a scout observe players and write meaningful evaluations during a live game?

Everything on this page exists to support that goal.

Scouting Matchup is **not**:

- a player profile,
- a statistics page,
- a report browser.

It is a live scouting environment.

9.2 Philosophy

Scouting Matchup is the heart of EuroScout.

Every other module supports this page.

Examples

Player Database → Find players

Scouting Matchup → Evaluate players

Reports → Summarize conclusions

Watchlist → Monitor progress

Shortlist → Recruitment

The user should spend more time inside Scouting Matchup than anywhere else in EuroScout.

9.3 Layout

The page permanently uses a three-column layout.

HOME TEAM		AWAY TEAM
Player List	PLAYER WORKSPACE	Player List
Search		Search
Filters		Filters
Team Notes	Notes	Team Notes
	Categories	
	Observation Editor	

This layout is approved.

It should not be redesigned.

9.4 Center Workspace

The center column is the most important part of the application.

It must always remain the largest panel.

Never reduce its width to make space for permanent statistics.

Purpose

Observe basketball.

Write notes.

Switch players.

Repeat.

Everything else is secondary.

9.5 Home Team

Contains

Roster

Search

Position Filter

Team Notes

Current Player Highlight

Nothing more.

The left panel exists purely for navigation.

9.6 Away Team

Exactly the same functionality.

Purpose

Quick switching between both teams.

Scouts constantly move between players.

Both rosters must always remain visible.

9.7 Player Header

Compact.

Never oversized.

Display

Profile Photo

Player Name

Position

Nationality

Birth Year

Age

Height

Weight

Club

Dominant Hand

Estimated Level

Follow

Automatic Signals

No duplicated information.

No large statistics.

9.8 Automatic Signals

Display automatically.

Examples

Coming out of College

Rookie in Europe

First Overseas Season

Breakout Season

Watchlist

High Upside

Signals are generated.

Never manually entered.

9.9 Estimated Level

Estimated Level is separate from Follow.

Example

[Green] Follow

[Blue] EuroCup

Possible values

EuroLeague

EuroCup

BCL

ABA

Top Domestic

Rotation

Development

High Upside

These represent scouting projection rather than workflow status.

9.10 Notes

Notes remain intentionally simple.

Example

Good secondary creator.

Excellent first step.

Needs stronger left hand.

Good transition defense.

No timestamps.
 No possession tracking.
 No quarter tracking.
 Scouting Matchup evaluates players.
 It does not analyse tactical sequences.

9.11 Categories

Approved categories

Offense

Defense

Athleticism

Shooting

Playmaking

Rebounding

IQ

Character

Projection

General

Categories help organise notes.

They should never interrupt writing.

9.12 Keyboard Workflow

Keyboard support is a core feature.

Examples

Ctrl + →

Next Player

Ctrl + ←

Previous Player

Ctrl + O

Offense

Ctrl + D

Defense

Ctrl + A

Athleticism

Ctrl + P

Projection

Ctrl + S

Save

Ctrl + Enter

New Observation

No Alt-based shortcuts.

The application must work well on iPad Magic Keyboard.

9.13 Quick Stats

Statistics never occupy permanent screen space.

They open through

[Statistics] Stats → Slide-out drawer.

Drawer contains

Current Season

Advanced Stats

Percentiles

League Rankings

Game Logs

The drawer closes without affecting note-taking.

9.14 Reports

Reports also open through a drawer.

Do not permanently occupy the page.

Recent reports remain available while scouting but should never reduce the central workspace.

9.15 Player Switching

Selecting another player should be instant.

No loading screen.

No page refresh.

The scout should move

Home → Away → Home → Away

continuously.

9.16 Team Notes

Every team supports separate Team Notes.

Example

Salon Vilpas

Good spacing.

Poor transition defense.

BC Kalev

Switch everything.

Physical guards.

Team Notes never mix with Player Notes.

9.17 Review Logging

Every viewed game automatically updates scouting history.

Watching a game counts as scouting activity even if no notes were written.

"Notes revised" logs should not clutter activity history.

Instead record

Viewed Game

Scouted Team

Scouted Players

9.18 Performance

Priority

Player Name → Observation Editor → Profile Photo → Signals → Statistics → Reports

Never block writing because statistics are still loading.

9.19 Must Never Change

The following principles are permanent.

- Three-column layout.
- Home roster on the left.
- Away roster on the right.
- Center workspace always largest.
- Statistics remain drawers.
- Reports remain drawers.
- No timestamps.
- No tactical timeline.
- Keyboard-first workflow.
- Light theme remains the default design.
- The page exists for live scouting, not player research.

9.20 Success Criteria

A professional scout should be able to watch an entire basketball game while remaining inside Scouting Matchup.

The page should support:

Switch Player → Write Observation → Switch Player → Write Observation

without interrupting concentration.

Everything else inside EuroScout should support this workflow.

End of Chapter 9

Approved Scouting Matchup Principles

- This is the centerpiece of EuroScout.
- Three-column layout is permanent.

- Center note-taking area is sacred.
- Home and Away rosters remain visible at all times.
- Stats and Reports open as drawers.
- Notes remain simple observations.
- Keyboard workflow is a first-class feature.
- Light theme is the reference design.
- Scouting speed always takes priority over showing more information.

Product Note

Scouting Matchup is the page that defines EuroScout.

When new functionality is proposed, ask:

Does this help a scout evaluate players faster during a live game?

If the answer is **no**, the feature should probably belong in Player Profile, Reports, Tournament Workspace or the Player Database instead.

This principle should guide every future redesign. The page should remain a **professional scouting workspace**, not evolve into a general player information page.

Chapter 10 - Player Database (EuroScout)

10.1 Purpose

The Player Database is the central scouting database of EuroScout.

It exists to answer one question:

Which players should I investigate?

Unlike Scouting Matchup, the Player Database is **not** intended for live scouting.

It is designed for:

- player discovery,
- research,
- comparison,
- filtering,
- market analysis.

The Player Database is the scout's research workspace.

10.2 Philosophy

The Player Database should feel like modern scouting software, not a spreadsheet.

The emphasis should always be:

Search → Filter → Compare → Evaluate

The database should remain open while the player profile appears beside it.

The user should never lose their search results.

10.3 Primary Workflow

Search → Filter → Player List → Open Profile → Evaluate → Watchlist → Scouting Matchup → Report → Review Queue

The Player Database is the starting point for professional scouting.

10.4 Layout

The Player Database uses a permanent split layout.

Search	
Filters	
Views	

Player List	Player Profile
(infinite scroll)	(drawer)

The database always remains visible.

Opening a player should never replace the page.

10.5 Infinite Scroll ★★★★★

Pagination should be removed.

Current

Page 1

Page 2

Page 3

Approved

Infinite Scroll

The database continuously loads additional players while preserving:

- search
- filters
- sorting
- scroll position

Users should never lose their place.

10.6 Search

Global search supports

Player

Club

EuroCup Bigs

U23

Watchlist

Free Agents

Draft

Saved Views become one-click filters.

10.9 Player Rows

Every player row displays

Profile Photo

Name

Position

Height

Birth Year

Nationality

Club

Competition

Estimated Level

Watchlist

Automatic Signals

Latest Statistics

Rows should remain compact but information-rich.

10.10 Profile Photos

Always display database profile photos.

Fallback → Player initials.

Never show initials behind existing profile photos.

10.11 Estimated Level

Displayed directly inside database rows.

Separate from Watchlist.

Examples

EuroLeague

EuroCup

BCL

ABA

Top Domestic

Development

Estimated Level represents player projection.

10.12 Automatic Signals

Displayed inside database rows.

Examples

Rookie in Europe

Coming out of College

Breakout

Watchlist

High Upside

Signals remain automatically generated.

10.13 Sorting

Supported sorting

Name

Age

Height

Position

Club

League

Competition

Estimated Level

Last Updated

Statistics

Never use

Newest

Oldest

inside the database.

Sorting should match basketball workflows.

10.14 Player Profile

Selecting a player opens

Player Profile

inside the same page.

The database always remains visible.

Users should never lose their filters or search position.

10.15 Compare Players

Selecting multiple players enables

Compare

The comparison should open inside a drawer.

Never replace the database.

10.16 Performance

Priority

Database Rows → Player Profile → Photos → Statistics → Reports

Scrolling should remain smooth regardless of database size.

10.17 Integration

The Player Database connects directly to

Watchlist

Review Queue

Reports

Scouting Matchup

Tournament Workspace

Player Timeline

Everything references PlayerID.

10.18 Must Never Change

The Player Database is not a statistics website.

It exists to discover and evaluate players.

Player Profile always opens beside the database.

Infinite Scroll replaces pagination.

Search and filters always remain visible.

Users should never lose their current search.

10.19 Success Criteria

A scout should be able to

Search → Open Player → Evaluate → Close Profile → Continue scrolling

without restarting the search.

The Player Database should feel like one continuous workspace.

End of Chapter 10

Approved Player Database Principles

- Infinite Scroll replaces pagination.
- Player Profile opens as a side drawer.
- Search position is never lost.
- Filters remain permanently available.
- Saved Views become a core workflow.
- Estimated Level and Automatic Signals appear directly in the database.
- Database is optimized for research rather than live scouting.
- Every row should answer "**Is this player worth investigating further?**"

Product Note

The Player Database should **not** try to show everything.

Its purpose is to help scouts identify promising players quickly and then move naturally into deeper evaluation.

The recommended workflow is:

Player Database → Player Profile → Watchlist → Scouting Matchup → Reports → Review Queue → Shortlist.

The database should therefore optimize for **speed of discovery**, not for displaying the maximum amount of information. The Player Profile, Reports and Statistics modules exist to provide depth after the initial discovery phase.

Chapter 11 - Player Profile

11.1 Purpose

The Player Profile is DragonHub's complete player intelligence page.

It answers one question:

Everything we know about this player.

Unlike Scouting Matchup, which focuses on observing a player during a game, the Player Profile combines every piece of information DragonHub has collected throughout the player's scouting history.

The Player Profile becomes the player's permanent home.

11.2 Philosophy

The Player Profile should **not** try to become another RealGM or Eurobasket.

Public websites already provide public information.

DragonHub provides the club's private basketball intelligence.

Therefore, the Player Profile should always prioritize:

1. Internal scouting knowledge.
2. Current evaluation.
3. Recent observations.
4. Public supporting data.

The profile should answer:

What do WE think about this player?

before showing

What statistics does he have?

11.3 Primary Workflow

Player Database → Player Profile → Read Summary → Read Reports → Compare Statistics → Follow → Watchlist → Review Queue

The Player Profile supports decision making.

It does not replace scouting.

11.4 Layout

Player Profile opens inside a side drawer or side panel.

Never replace the Player Database.

Structure

Player Header → Scout Summary → Quick Stats → Tabs Overview Notes Reports Stats Timeline Career Media

The profile should always remain lightweight and fast.

11.5 Player Header

Display

Profile Photo

Name

Nationality

Position

Height

Weight

Birth Year

Age

Club

League

Dominant Hand

Agent (optional)

Contract (optional)

Current Competition

Automatic Signals

Follow

Estimated Level

Header should remain compact.

Never display duplicated information.

11.6 Scout Summary ★★★★★

This becomes the first thing every scout reads.

Structure

Scout Summary

Strengths

Areas for Improvement

Projection

Overall Recommendation

The summary should be editable.

Eventually AI may assist with generating drafts.

The Scout Summary should always appear before statistics.

11.7 Automatic Signals

Display directly below the bio.

Examples

Coming out of College

Rookie in Europe

First Overseas Season

Breakout Season

Watchlist

Top Prospect

Signals remain automatically generated.

11.8 Estimated Level

Estimated Level represents basketball projection.

It is independent from Follow.

Examples

EuroLeague

EuroCup

BCL

ABA

Domestic Starter

Development

NCAA Prospect

Estimated Level should be displayed beside Follow.

Different colour.

Never combine both concepts.

11.9 Tabs

Approved tabs

Overview

Notes

Reports

Stats

Timeline

Career

Media

No additional tabs unless clearly justified.

11.10 Overview

Overview contains

Scout Summary

Latest Observation

Latest Report

Estimated Level

Quick Statistics

Recent Activity

This should answer:

"What is this player today?"

11.11 Notes

Shows every observation linked to PlayerID.

Sources include

Game Notebook

Tournament Workspace

Tryout

Video

Manual Notes

Sorted chronologically.

Searchable.

Filterable.

11.12 Reports

Displays every report connected to the player.

Player Reports

Tournament Reports

Game Reports

Tryout Reports

Video Reports

Opening a report never leaves the Player Profile.

11.13 Statistics

Statistics remain supporting information.

Display

Current Season → Career → Advanced

Every statistics page displays

Source

Last Updated

Refresh Schedule

Statistics never hide scouting information.

11.14 Timeline ★★★★★

Timeline becomes the player's chronological history.

Example

2026 Tournament Observation → Player Report → Watchlist → Scouting Matchup → Tryout → Club Change

Everything remains linked.

11.15 Career

Career shows

Season

Club

Competition

Games

Role

Historical clubs should reference Club Registry.

11.16 Media

Contains

Videos

Photos

Attachments

External Links

Never embed unnecessary content.

11.17 Quick Actions

Every Player Profile supports

Follow

Watchlist

Shortlist

Generate Report

Copy Link

Archive

Actions remain grouped together.

11.18 Performance

Priority

Header → Scout Summary → Profile Photo → Notes → Reports → Statistics → Media

The profile should feel instant.

11.19 Relationships

Player Profile automatically displays connected

Reports

Games

Tournaments

Events

Competitions

Clubs

Everything references PlayerID.

No manual linking.

11.20 Must Never Change

The Player Profile exists to present the club's scouting knowledge.

Statistics remain secondary.

The Scout Summary always appears first.

Player Profile opens beside the database.

The database remains visible.
 Timeline remains chronological.
 Everything references PlayerID.

11.21 Success Criteria

Opening any player should immediately answer:

- Who is this player?
- How good do we think he is?
- What have we written about him?
- What level can he reach?
- What should we do next?

Without opening another page.

End of Chapter 11

Approved Player Profile Principles

- Player Profile is the player's permanent home.
- Internal scouting intelligence always takes priority over public statistics.
- Scout Summary is the first thing every user sees.
- Timeline connects every observation ever written.
- Statistics support evaluation rather than replace it.
- Player Database always remains visible while viewing the profile.
- Follow and Estimated Level are independent concepts.
- The Player Profile is designed for decision making, not data storage.

Product Note

The Player Profile is the destination where every workflow converges.

A player may first appear through:

- Tournament Workspace
- Game Notebook
- Scouting Matchup
- Reports
- Watchlist
- Review Queue

Regardless of where the observation originated, everything should eventually be visible inside the Player Profile.

This page therefore becomes the **institutional memory** of the basketball department. It should answer not only *who the player is*, but also *what the club has learned about him over time*. That makes the Player Profile one of the most strategically important modules in DragonHub, and every future feature should enrich it rather than duplicate its information elsewhere.

Chapter 12 - Watchlist

12.1 Purpose

The Watchlist is not another player database.

It is a dynamic scouting workspace containing players that currently require continued observation.

It answers one question:

Which players should I continue following?

The Watchlist is designed around **future scouting**, not historical information.

12.2 Philosophy

The Player Database contains every player.

The Watchlist contains only players that currently matter.

Adding a player to the Watchlist means:

"This player deserves another evaluation before making a decision."

The Watchlist is therefore a **working list**, not permanent storage.

12.3 Primary Workflow

Player Database → Player Profile → Follow → Watchlist → Scout Next Game → Review Queue → Shortlist → Recruitment Decision

The Watchlist always leads somewhere.

It is never the final destination.

12.4 Layout

The page is organized around workflow rather than data.

Search

Filters

Saved Views

Watchlist Players

Selected Player

Quick Summary

The page should remain lightweight.

12.5 Player Cards

Every player card displays

- Profile Photo
- Name
- Position
- Club

- Nationality
- Estimated Level
- Follow Status
- Last Seen
- Next Game
- Number of Reports

The card should answer

"Should I scout this player again?"

without opening the profile.

12.6 Next Game ★★★★★

Next Game is displayed only inside:

- Watchlist
- Review Queue
- Shortlist

Never inside the full Player Database.

DragonHub should only track fixtures for players that matter.

Display

Tomorrow
vs Partizan
ABA League

or

No scheduled game

12.7 Last Seen

Display

Last game observed.

Example

17 Sep
vs Krka

This immediately tells the scout how recent the evaluation is.

12.8 Estimated Level

Displayed directly beside

Follow.

Example

[Green] Follow
[Blue] EuroCup

Different colours.

Separate concepts.

12.9 Saved Views

Examples

High Priority

EuroLeague Targets

ABA Targets

Young Guards

Free Agents

Centers

Watchlist becomes highly personalised.

12.10 Filters

Next Game

Last Seen

Report Count

Everything supports multi-selection.

12.11 Notes Preview

Every player card displays the latest scouting observation.

Example

Excellent decision maker.

Needs stronger left hand.

No need to open the profile.

12.12 Quick Actions

Each player supports

Open Profile

Open Scouting Matchup

Generate Report

Move to Review Queue

Move to Shortlist

Archive

Everything accessible in one click.

12.13 Automatic Behaviour

Whenever a player is added to Watchlist:

DragonHub automatically begins tracking

- Next Game
- Last Seen
- Statistics Refresh
- Timeline

No manual setup required.

12.14 Statistics

The Watchlist displays only key statistics.

Current Season → PTS

REB

AST

Minutes

Efficiency

Everything else remains inside Player Profile.

12.15 Performance

Priority

Player Cards → Profile Photos → Next Game → Statistics → Reports

The page should always remain responsive.

12.16 Integration

Watchlist connects directly with

Player Profile

Scouting Matchup

Reports

Review Queue

Shortlist

Player Timeline

No duplicated data.

12.17 Must Never Change

The Watchlist is not another database.

It is not a report list.

It is a scouting workflow.

Only active players belong here.

Every player should naturally progress toward Review Queue or Shortlist.

12.18 Success Criteria

Opening the Watchlist should immediately answer:

- Who needs another viewing?
- When do they play next?
- When did I last scout them?
- What was my last impression?
- What should I do next?

Without opening another page.

End of Chapter 12

Approved Watchlist Principles

- Watchlist is a workflow, not a database.
- Next Game only appears for actively followed players.
- Last Seen is as important as Next Game.
- Estimated Level remains separate from Follow.
- Latest observation is visible directly in the list.
- Every player should naturally progress to Review Queue or Shortlist.
- The Watchlist exists to answer "**Who should I scout next?**"

Product Note

One of the biggest differences between DragonHub and traditional scouting databases is that **players move through the system**.

The Watchlist is not where players stay forever.

Instead, every player should eventually follow one of three paths:

Watchlist → Review Queue → Shortlist

or

Watchlist → Archived

or

Watchlist → Removed (No longer followed)

This means the Watchlist is a **living workspace**, constantly changing as new players emerge and previous targets are evaluated. It should always contain the players that deserve the scout's attention **today**, rather than becoming a permanent collection of names. That philosophy should remain unchanged regardless of future feature additions.

Chapter 13 - Review Queue

13.1 Purpose

Review Queue is DragonHub's scouting task manager.

Unlike Watchlist, which tracks players, Review Queue tracks **unfinished scouting work**.

It answers one question:

What should I work on today?

This page should always contain actionable tasks.

13.2 Philosophy

Review Queue is **not another player list**.

It is a prioritized workflow.

Every player inside Review Queue requires an action before a recruitment decision can be made.

Examples

- Needs another viewing
- Needs report
- Needs statistics
- Needs discussion
- Needs final recommendation

13.3 Primary Workflow

Watchlist → Review Queue → Complete scouting work → Shortlist → Recruitment

Every player eventually leaves Review Queue.

13.4 Layout

```

-----
Search
Filters
Saved Views
-----
Review Queue
-----
Selected Player
Tasks
Notes
Next Action
-----

```

The page focuses on **tasks**, not player information.

13.5 Queue Sections

Players are automatically grouped.

Approved sections

Needs First Viewing

Needs Second Viewing

Needs Final Report

Needs Discussion

Waiting for Statistics

Ready for Decision

Archived

The queue should immediately communicate workload.

13.6 Player Card

Each player displays

Profile Photo

Name

Club

Competition

Estimated Level

Last Seen

Next Game

Task

Priority

Deadline (optional)

Latest Observation

The card should explain exactly why the player is in the queue.

13.7 Next Game

Display

Next scheduled game.

Example

Tomorrow
vs Partizan
ABA League

This helps schedule the next scouting opportunity.

13.8 Last Seen

Display

Most recent live observation.

Example

Observed
17 Sep
vs Krka

Allows scouts to quickly judge how current their evaluation is.

13.9 Tasks ★★★★★

Every player requires one primary task.

Examples

Watch another game

Write Player Report

Update Notes

Discuss with staff

Scout live

Archive

Tasks should be simple.

13.10 Priority

Every player supports

High

Medium

Low

Priority determines sorting.

13.11 Estimated Level

Displayed next to Follow.

Same behaviour as throughout DragonHub.

13.12 Quick Actions

Each player supports

Open Player Profile

Open Scouting Matchup

Open Tournament Workspace

Generate Report

Move to Shortlist

Archive

Everything should remain accessible from one menu.

13.13 Smart Suggestions (Future)

DragonHub may later suggest

"Two viewings completed.

Generate report?"

or

"No observations for six months.

Archive?"

These remain optional future enhancements.

13.14 Automatic Entry

Players enter Review Queue automatically when Watchlist player reaches required scouting stage.

Examples

Second live viewing completed.

Player Report missing.

Tournament completed.

Tryout completed.

The user should not manually populate Review Queue.

13.15 Exit Conditions

Players leave Review Queue through

Move to Shortlist

Archive

Remove from Watchlist

Decision completed

The queue should remain active.

13.16 Performance

Priority

Player Cards → Tasks → Profile Photos → Next Game → Statistics

The queue should open immediately.

13.17 Integration

Review Queue connects directly to

Watchlist

Player Profile

Reports

Scouting Matchup

Tournament Workspace

Player Timeline

No duplicated information.

13.18 Must Never Change

Review Queue is not another database.

It is not another Watchlist.

It is a task manager.

Every player must have a reason for being here.

Every player should eventually leave.

The page should always answer

"What should I work on next?"

13.19 Success Criteria

Opening Review Queue should immediately show

- Which player requires attention.
- Why.
- What the next scouting action is.
- When that player plays again.
- Whether enough information exists to make a decision.

Without opening another module.

End of Chapter 13

Approved Review Queue Principles

- Review Queue is a scouting task manager.
- Every player must have an active task.
- Players automatically enter and leave the queue.
- Next Game and Last Seen remain core information.
- Tasks are more important than statistics.
- Review Queue naturally leads toward Shortlist or Archive.
- The page exists to answer **"What should I scout or finish today?"**

Product Note

Review Queue is one of the key workflow differences between DragonHub and traditional scouting databases.

Most databases stop after storing player information.

DragonHub continues guiding the scouting process until a decision is reached.

The Review Queue therefore acts as the bridge between **evaluation** and **recruitment**.

Every player should eventually progress to one of three outcomes:

Review Queue → Shortlist → Recruitment

or

Review Queue → Archive

or

Review Queue → Back to Watchlist

This ensures the scouting process never stalls and every player always has a clear next step. The Review Queue should remain a **living operational workspace**, not another place where players accumulate indefinitely.

Chapter 14 - Shortlist

14.1 Purpose

The Shortlist is the recruitment board of DragonHub.

Unlike the Watchlist or Review Queue, the Shortlist contains only players that the club is seriously considering.

It answers one question:

Which players are realistic recruitment targets?

Every player on the Shortlist should already have enough scouting information to support meaningful basketball discussions.

14.2 Philosophy

The Shortlist is not another Watchlist.

It is not another database.

It is the final scouting stage before recruitment.

Adding a player to the Shortlist means:

"We believe this player is a realistic option for our club."

Because of this, the Shortlist should remain relatively small.

Quality is more important than quantity.

14.3 Primary Workflow

Player Database → Watchlist → Review Queue → Shortlist → Recruitment → Signing or Remove

The Shortlist should never become permanent storage.

14.4 Layout

Search
Filters
Views

Shortlisted Players

Selected Player
Recruitment Summary

The page should immediately communicate recruitment readiness.

14.5 Player Card

Every player displays

The page should remain responsive even with large scouting histories.

14.18 Integration

Shortlist connects directly to
 Player Profile
 Reports
 Watchlist
 Review Queue
 Timeline
 Club Registry
 Competition Registry
 No duplicated information.

14.19 Must Never Change

The Shortlist is the final scouting stage.
 It is not another database.
 Every player should already have sufficient scouting information before appearing here.
 Recruitment Summary remains the primary information.
 Reports support decisions.
 Statistics support reports.
 Everything should guide recruitment.

14.20 Success Criteria

Opening the Shortlist should immediately answer

- Who are our best recruitment targets?
- Which positions still require players?
- Which players require another viewing?
- Which players are ready for recruitment discussions?
- What is our current opinion of every target?

Without opening another module.

End of Chapter 14

Approved Shortlist Principles

- Shortlist represents recruitment, not scouting.
- Only serious targets belong here.
- Recruitment Summary is always the primary information.
- Comparison is a core workflow.
- Reports, Timeline and Statistics support recruitment decisions.
- Next Game remains visible while evaluating targets.
- The page should answer **"Who should we sign?"**, not **"Who should we scout?"**

Product Note

The Shortlist is the point where DragonHub transitions from a **scouting platform** into a **basketball decision-support system**.

By the time a player reaches the Shortlist:

- discovery is complete,
- scouting is largely complete,
- reports already exist,
- timelines are populated,
- tournament observations are linked,
- statistics are available,
- the player's role and projection have been evaluated.

At this stage, the platform should help the basketball department compare options, discuss recruitment, and make informed decisions - not collect more data.

The Shortlist should therefore remain **small, curated and actionable**. It represents the club's strongest current recruitment options, not simply another collection of interesting players.

Chapter 15 - Free Agents

15.1 Purpose

The Free Agents module is DragonHub's professional market monitoring tool.

It answers one question:

Which available players are realistic options for our club today?

Unlike the Player Database, which contains every professional player, the Free Agents module contains only players currently available on the market.

This module supports professional recruitment rather than scouting.

15.2 Philosophy

The Free Agents module should not become another player list.

It is a live recruitment board.

The objective is to allow scouts and sporting directors to immediately identify available players that fit the club's needs.

The page should answer:

- Who is available?
- At what level?
- Are they worth contacting?

15.3 Primary Workflow

Market Update → Available Player → Player Profile → Reports → Watchlist → Shortlist → Recruitment

The Free Agents page exists to accelerate market decisions.

15.4 Layout

Statistics Engine

Club Registry

Competition Registry

Everything references PlayerID.

15.17 Performance

Priority

Player List → Player Profile → Photos → Statistics → Reports

Market information should never slow the page.

15.18 Must Never Change

The Free Agents page is a recruitment tool.

Not a statistics page.

Not another Player Database.

Availability always takes priority over statistics.

Player evaluation remains more important than market information.

15.19 Success Criteria

Opening Free Agents should immediately answer

- Which players are currently available?
- Which ones fit our level?
- What do we think about them?
- Are they worth contacting?

Without opening another page.

End of Chapter 15

Approved Free Agent Principles

- Market-first workflow.
- Availability is the key piece of information.
- Estimated Level remains separate from Availability.
- Reports remain more valuable than statistics.
- The page exists to support professional recruitment decisions.
- Free Agents reuse the same Player Profile and database architecture as every other module.

Product Note

The Free Agents module should feel like a **live transfer board**, not another player database.

Everything should help answer one practical basketball question:

"If we needed to sign a player today, who are our best realistic options?"

The module should therefore emphasize:

- availability,
- scouting evaluation,
- estimated level,
- latest reports,
- recent statistics,

while avoiding unnecessary historical information. It should integrate seamlessly with Watchlist, Review Queue and Shortlist so that market opportunities naturally flow into the club's existing recruitment workflow without creating duplicate processes.

Chapter 16 - Team List

16.1 Purpose

The Team List is DragonHub's club intelligence module.

It answers one question:

What do we know about this basketball organization?

Unlike the Player Database, which focuses on individuals, the Team List focuses on basketball organizations. Every club becomes the center of its own ecosystem.

16.2 Philosophy

The Team List should **not** be another spreadsheet of club names.

Every team should become a connected basketball object.

The Team List exists to support:

- scouting,
- tournament preparation,
- roster analysis,
- opponent preparation,
- player discovery.

16.3 Primary Workflow

Search Club → Open Club Profile → Roster → Reports → Players → Games → Tournament Workspace → Scouting Matchup

The Team List becomes the entry point into every club.

16.4 Layout

```

-----
Search
Filters
Saved Views
-----
Team List
-----
Club Profile Drawer
-----

```

Exactly the same philosophy as the Player Database.

No page changes.

Everything remains in one workspace.

16.5 Club Registry Integration ★★★★★

Every club displayed here comes directly from the Club Registry.

Never display duplicated clubs.

Examples

BC Vienna

Vienna

Basketball Club Vienna → One club.

One profile.

One roster.

One history.

16.6 Team Card

Every team displays

Club Logo

Official Name

Country

Coach Changed

Competition Changed

Tournament Played
Scouting Report
Everything chronological.

16.16 Team Notes

Every club supports Team Notes.

Example

Excellent spacing.
Switch aggressively.
Weak transition defense.
Prefer small lineups.

Team Notes remain independent from player observations.

16.17 Tournament Integration

This chapter connects directly with Tournament Workspace.

Import Tournament → Import Teams → Club Registry → Current Rosters → Players → Tournament Workspace

The Team List therefore becomes the foundation for tournament scouting.

16.18 Scouting Matchup Integration

Scouting Matchup should never maintain independent rosters.

Instead

Game → Club Registry → Current Roster → Scouting Matchup

Everything shares the same source.

16.19 Performance

Priority

Team List → Club Profile → Logo → Roster → Reports → Statistics

Team pages should open instantly.

16.20 Must Never Change

Every club exists exactly once.

Everything references ClubID.

Roster always comes from Club Registry.

Aliases always resolve automatically.

Tournament Workspace and Scouting Matchup never maintain independent team data.

Club Profile opens beside the Team List.

Never replace the Team List page.

16.21 Success Criteria

Opening a club should immediately answer:

- Who plays for this team?

- Which competition do they play in?
- What reports do we already have?
- Which players interest us?
- How has the roster changed?
- What do we know about this organization?

Without opening another module.

End of Chapter 16

Approved Team List Principles

- Team List is built on the Club Registry.
- One ClubID per organization.
- One roster shared across DragonHub.
- Club Profile opens inside a side drawer.
- Historical rosters are preserved.
- Team Notes remain separate from Player Notes.
- Tournament Workspace and Scouting Matchup consume the same roster data.
- The Team List exists to understand organizations, not simply list them.

Product Note

The **Team List** is much more than a directory of clubs.

It is the **organizational counterpart** to the Player Profile.

Just as every player has a permanent Player Profile, every basketball organization should have a permanent Club Profile built on the Club Registry.

This becomes the foundation for:

- Tournament Workspace,
- Scouting Matchup,
- Calendar,
- Events,
- Reports,
- Roster imports,
- Club history,
- and future analytics.

By centralizing all club information into one shared object, DragonHub eliminates duplicate team data, simplifies imports, and ensures that every module always works with the same roster and club identity. This principle should remain one of the core architectural foundations of the platform.

Chapter 17 - Youth Database

17.1 Purpose

The Youth Database is DragonHub's long-term talent identification platform.

It answers one question:

Which young players have the highest long-term potential?

Unlike the Pro Database, which focuses on recruitment, the Youth Database focuses on **development and projection**.

The database should help identify future professional players before they become widely known.

17.2 Philosophy

The Youth Database is not built around current performance.

It is built around **future projection**.

Current statistics are supporting information.

The most important information is:

Potential.

Projection.

Development trajectory.

Character.

Basketball IQ.

The question is never

"Who is the best player today?"

The question is

"Who could become the best player in three years?"

17.3 Primary Workflow

Tournament → Youth Database → Watchlist → Reports → Timeline → Promotion to Pro Database

The Youth Database feeds the future.

17.4 Player Lifecycle ★★★★★

Every player follows one lifecycle.

Discovery → Youth Database → Reports → Watchlist → Development → Promotion → Pro Database

Promotion should never create a duplicate player.

The same PlayerID remains.

Only the database category changes.

17.5 Layout

The layout follows exactly the same philosophy as Pro Database.

Search

Watchlist

Generate Report

Compare

Open Tournament Workspace

Open Timeline

Promote to Pro Database (Admin)

17.18 Performance

Priority

Player List → Profile → Photos → Reports → Statistics

Youth scouting should always feel responsive.

17.19 Must Never Change

Youth Database is built around potential.

Not current production.

Estimated Ceiling remains more important than statistics.

Players keep the same PlayerID throughout their career.

Promotion never creates duplicates.

Youth Database and Pro Database remain visually identical.

Only their scouting philosophy differs.

17.20 Success Criteria

Opening the Youth Database should immediately answer:

- Which players have the highest ceiling?
- Who should we continue following?
- How has this player developed?
- Which tournaments have we already scouted?
- Is this player ready to move into the professional scouting process?

Without opening another module.

End of Chapter 17

Approved Youth Database Principles

- Built around long-term projection.

- Potential before production.
- Estimated Ceiling replaces Estimated Level.
- Promotion never duplicates players.
- Tournament Workspace feeds Youth Database automatically.
- Reports and Timeline remain shared.
- Youth Database and Pro Database use the same design system.
- One PlayerID throughout the player's entire career.

Product Note

The Youth Database is not simply a database of younger players.

It is the **future pipeline** of DragonHub.

Its purpose is to identify talent years before professional recruitment begins and maintain a continuous scouting history throughout the player's development.

When a player eventually signs his first professional contract, nothing should be migrated, copied or recreated. The same PlayerID, reports, tournament observations, timelines and scouting history continue seamlessly into the Pro Database.

This continuity is one of DragonHub's greatest competitive advantages because it allows the club to build **multi-year scouting histories** instead of disconnected snapshots. A scout should be able to open a professional player in 2032 and immediately see observations that were written when he was 14 years old. That long-term institutional memory should remain one of DragonHub's defining product principles.

Chapter 18 - KZS Youth Stats

18.1 Purpose

KZS Youth Stats is DragonHub's Slovenian youth basketball intelligence platform.

It answers one question:

What is happening inside Slovenian youth basketball?

Unlike the international Youth Database, KZS Youth Stats focuses exclusively on competitions organized by the Basketball Federation of Slovenia (KZS).

It combines:

- official competitions,
- official statistics,
- player tracking,
- club development,
- long-term scouting.

The module serves both academy recruitment and long-term domestic scouting.

18.2 Philosophy

KZS Youth Stats is **not** simply an official statistics viewer.

Official statistics already exist.

DragonHub combines those statistics with the club's internal scouting knowledge.

The objective is to answer:

Which Slovenian players deserve our attention?

not

Who scored the most points yesterday?

18.3 Primary Workflow

Official KZS Data → Automatic Import → KZS Youth Stats → Player Profiles → Reports → Watchlist → Promotion → Youth Database → Pro Database

The module becomes the official Slovenian pipeline.

18.4 Layout

The design follows the same design language as every other DragonHub module.

Search → Filters → Player List → Player Profile Drawer

The user should immediately recognize the interface.

No separate design language.

18.5 Data Source

Primary source → Official KZS

DragonHub imports

- Players
- Clubs
- Games
- Statistics
- Standings
- Fixtures

Internal scouting data remains independent.

18.6 Search

Supports

Player

Club

League

Birth Year

Competition

Aliases

Searching should feel identical to every other database.

18.7 Filters

Approved filters

Birth Year

Competition

Club

Position

Height

Nationality

League

Watchlist

Estimated Ceiling

Everything supports multi-selection.

18.8 Statistics

Statistics remain official.

Display

Current Season → Career inside KZS → Game Logs → Advanced Statistics

Every statistics page displays

Source → Official KZS → Last Updated → Refresh Schedule

18.9 Refresh Policy

Because this module is built around one federation

Refresh

Daily

during the season.

Off-season → Weekly

Statistics should always remain reliable rather than live.

18.10 Player Profile

Uses the same Player Profile shared by

Youth Database → Pro Database → KZS

The profile does not change.

Only the source of information changes.

18.11 Estimated Ceiling

Youth philosophy remains.

Current performance supports projection.

Projection remains the primary scouting evaluation.

18.12 Club Profiles

Every Slovenian club references

Club Registry.

Never duplicate clubs.

Everything references ClubID.

18.13 Competition Profiles

Every KZS competition references

Competition Registry.

Examples

U14

U16

U18

Kadeti

Juniores

Everything remains connected.

18.14 Reports

Every report linked to Slovenian players automatically appears inside KZS.

Sources

Game Notebook

Tournament Workspace

Player Reports

Video Reports

Tryouts

Nothing is duplicated.

18.15 Promotion Workflow

Outstanding Slovenian prospects → Youth Database → International scouting → Professional basketball

The same PlayerID remains throughout the player's career.

18.16 Automatic Signals

Support

National Team

Debut Season

High Upside

Watchlist

Top Prospect

Breakout

Signals remain automatic.

18.17 Team Rosters

Current season rosters should always be available.

The user should never manually recreate KZS rosters.

The system imports → Club → Roster → Players → Statistics

Everything automatically.

18.18 Performance

Priority

Player List → Player Profile → Photos → Statistics → Reports

KZS should remain extremely responsive because it will likely become one of the largest databases.

18.19 Must Never Change

KZS Youth Stats is not a copy of the official KZS website.

DragonHub enhances official information with scouting intelligence.

Official statistics remain supporting information.

Reports and observations remain the primary value.

The Player Profile remains identical to every other database.

Only the source of data changes.

18.20 Success Criteria

Opening KZS Youth Stats should immediately answer:

- Which Slovenian prospects deserve attention?

- How are they developing?
- What have we written about them?
- Which clubs are producing talent?
- Which players are ready for international scouting?

Without leaving DragonHub.

End of Chapter 18

Approved KZS Youth Stats Principles

- Official KZS data powers the module.
- DragonHub adds scouting intelligence.
- One shared Player Profile.
- One shared Club Registry.
- One shared Competition Registry.
- Daily updates during the season.
- Player progression remains more important than raw statistics.
- KZS acts as the domestic scouting pipeline into the Youth Database.

Product Note

KZS Youth Stats is not intended to compete with the official KZS website.

Instead, it should become the **working environment** for Slovenian scouting.

The official website provides scores and standings.

DragonHub provides:

- scouting observations,
- reports,
- timelines,
- projections,
- watchlists,
- development history,
- recruitment support.

The long-term vision is that every promising Slovenian player begins in **KZS Youth Stats**, progresses into the **Youth Database**, and eventually reaches the **Pro Database**, all while keeping the same PlayerID and complete scouting history. This creates a seamless domestic-to-professional pathway and ensures that no knowledge is lost as players advance through their careers.

Chapter 19 - Relationships, Timelines & Knowledge Graph

19.1 Purpose

DragonHub is not a collection of pages.

It is a connected basketball knowledge system.

Every important object inside DragonHub should know how it relates to every other object.

This chapter defines those relationships.

19.2 Philosophy

Nothing inside DragonHub should exist in isolation.

Every object should automatically connect to related information.

The user should never manually search for information that DragonHub already knows is related.

Example

Open Player → Automatically display

Reports

Timeline

Games

Tournaments

Videos

Club

Competition

Everything.

19.3 Core Objects

DragonHub consists of six primary objects.

Player

Club

Competition

Game

Event

Report

Everything references these objects.

No module creates independent versions.

19.4 Relationships

Every object supports relationships.

Example

Player → belongs to

Club → plays in

Competition → participates in

Game → belongs to

Event → creates

Report

Everything becomes connected.

19.5 Player Relationships

Every player automatically connects to

Reports → Games → Events → Clubs → Competitions → Timeline → Videos → Statistics → Watchlist → Review Queue → Shortlist

Nothing should require manual linking after PlayerID is known.

19.6 Club Relationships

Every club automatically connects to

Roster → Games → Reports → Events → Competitions → Timeline → Historical Rosters → Player Profiles

Everything references ClubID.

19.7 Competition Relationships

Every competition connects to

Teams → Games → Players → Reports → Events → Statistics → Standings → Fixtures

Everything references CompetitionID.

19.8 Game Relationships

Every game automatically connects to

Home Club

Away Club

Players

Reports

Game Notebook

Scouting Matchup

Statistics

Timeline

Nothing is duplicated.

19.9 Event Relationships

Every Event connects to

Competition → Teams → Players → Tournament Workspace → Reports → Timeline → Games

Everything should already exist before scouting begins.

19.10 Report Relationships ★★★★★

Every report may reference

One Player

Multiple Players

One Club

Multiple Clubs

One Game

One Event

One Competition

Examples

Tryout Report → Multiple players

Tournament Report → Multiple players

Player Report → One player

Game Report → One game

Everything remains connected.

19.11 Timeline Engine

Every important action creates a Timeline event.

Examples

Player observed

Game Notebook

Tournament Observation

Player Report

Tryout

Watchlist

Shortlist

Club Change

Competition Change

Everything becomes chronological.

19.12 Timeline Philosophy

Timeline is

history.

Not notes.

Timeline should answer

"What has happened?"

Not

"What do we think?"

Observations remain inside Reports.

Timeline displays
when
those reports were created.

19.13 Knowledge Graph ★★★★★

Eventually DragonHub should behave like a basketball knowledge graph.

Example

Open

Karl Chavis

DragonHub immediately knows

Current Club → Recent Reports → Tournament Observations → Games → Watchlist → Shortlist → Teammates
→ Coach → Competition → Upcoming Game

Without searching.

19.14 Automatic Linking

Whenever the system detects

PlayerID

ClubID

CompetitionID

GameID

EventID

everything should automatically connect.

The user should never manually recreate relationships.

19.15 Relationship Priorities

Priority order

Player → Club → Competition → Game → Event → Report

Everything ultimately supports Player evaluation.

19.16 Cross-module Navigation

Every relationship becomes clickable.

Example

Player → Club → Roster → Tournament → Reports → Back

No dead ends.

Every object becomes a navigation hub.

19.17 Search

Global Search should understand relationships.

Searching

Kar1 Chavis

should immediately display

Player

Reports

Games

Tournament

Club

Watchlist

Timeline

No separate searches.

19.18 Future AI

Future versions may use these relationships.

Examples

"You have watched Karl Chavis three times."

"You already have six reports on BC Kalev."

"This player was last observed 142 days ago."

Everything becomes possible because relationships already exist.

19.19 Must Never Change

Every object references IDs.

Never plain text.

Relationships are automatic.

No duplicate information.

Reports remain connected forever.

Timeline remains chronological.

Everything is discoverable.

19.20 Success Criteria

A user opening any object should immediately see everything related to it.

The user should never wonder

"Where did I write that observation?"

DragonHub already knows.

End of Chapter 19

Approved Relationship Principles

- DragonHub is a connected knowledge system.
- Every object references IDs, never text.
- Relationships are automatic.
- Timeline records history, not opinions.
- Reports remain permanent.
- Global Search follows relationships.

- Every object becomes a navigation hub.
- Write once, reuse everywhere.

Product Note

This chapter defines what I believe is DragonHub's **greatest long-term competitive advantage**.

Most scouting platforms are collections of disconnected pages.

DragonHub should instead behave like a **basketball knowledge graph**.

That means information is never stored twice, relationships are automatic, and every observation enriches the entire system rather than a single page.

When a scout opens any player, club, game or tournament, DragonHub should already understand how that object connects to everything else the club has learned.

This transforms DragonHub from a database into an **institutional memory** for the basketball department. Years later, a scout should still be able to reconstruct a player's complete journey - from his first youth tournament to his professional career - without manually searching through folders, reports or notebooks. That continuity of knowledge should remain one of DragonHub's defining principles.

Chapter 20 - Design System & User Experience

20.1 Purpose

DragonHub should never feel like multiple connected websites.

It should feel like one professional application.

Every module must follow the same visual language.

A user should immediately recognize that they are still inside DragonHub regardless of which module they open.

20.2 Philosophy

Consistency is more important than creativity.

Every page should reuse existing components whenever possible.

If a component already exists elsewhere in DragonHub, reuse it.

Never redesign it.

The application should evolve through consistency rather than variety.

20.3 Visual Identity

DragonHub should communicate

Professional

Clean

Fast

Trustworthy

Calm

The interface should never feel playful or decorative.

Basketball information remains the hero.

The interface supports it.

20.4 Layout Philosophy

Every page follows the same hierarchy.

Header → Filters → Content → Details → Actions

Users should immediately understand where to look.

20.5 White Space

White space is functional.

It improves reading.

It is never considered wasted space.

Never fill empty areas simply because space exists.

20.6 Cards

Cards become the standard information container.

Every card follows the same rules.

Rounded corners.

Soft border.

Minimal shadow.

Consistent padding.

No unnecessary colors.

Cards should never compete with each other.

20.7 Colors

Colors communicate information.

Never decoration.

Approved meanings

[Green] Actions

Follow

Save

Success

[Blue] Estimated Level

EuroLeague

EuroCup

BCL

[Purple] Automatic Signals

High Upside

Rookie in Europe

[Orange] Warnings

Needs Review

Missing Data

[Red] Errors

Failed Import

Missing Registry

System Errors

Grey

Metadata

Secondary Information

Everything else remains neutral.

20.8 Team Colors

Every team owns one color.

The same color appears in

Dashboard

Calendar

Roster

Scouting Matchup

Reports

Tournament Workspace

Never invent new colors for the same team.

20.9 Chips

Chips remain compact.

Purpose

Metadata only.

Examples

Pro

U18

Club Tournament

Scouting

Online

EuroCup

Watchlist

Estimated Level

Chips never become large buttons.

20.10 Buttons

Buttons exist only for actions.

Not labels.

Primary

Green

Secondary

Grey

Danger

Red

Never create unnecessary button styles.

20.11 Tables

Tables remain

Readable

Sortable

Searchable

Infinite scrolling replaces pagination whenever practical.

Large databases should never use page numbers.

20.12 Profile Photos

Every profile photo follows the same rule.

If photo exists → Show photo.

If no photo → Show initials.

Never render both.

20.13 Progressive Loading

DragonHub should always load

Structure → Names → Content → Images → Statistics → Additional metadata

Users should begin working immediately.

Never block rendering.

20.14 Drawers

Drawers become standard.

Use drawers instead of navigating away.

Examples

Player Profile

Club Profile

Statistics

Reports

Timeline

Compare

The underlying page always remains visible.

20.15 Search

Every search behaves identically.

Search → Autocomplete → Aliases → Instant Results

Never require scrolling through enormous dropdowns.

20.16 Filters

Filters always appear directly below Search.

Order

Search → Filters → Saved Views → Content

This order remains identical throughout DragonHub.

20.17 Saved Views

Every major database supports Saved Views.

Player Database

Free Agents

Watchlist

Review Queue

Team List

Youth Database

Users should never rebuild the same filter repeatedly.

20.18 Navigation

Text → Navigate

Numbers → Explain

Examples

Player Name → Profile

24 Reports → Report List

2 Games → Game Popup

The interaction model remains consistent across every module.

20.19 Performance Philosophy

Performance is part of UX.

Fast applications feel simpler.

Loading indicators should rarely be visible.

Images and metadata should progressively appear without interrupting work.

20.20 Dark Mode

Dark Mode supports the same layout.

Never redesign pages separately.

Only colors change.

Buttons must always remain clearly visible.

Green buttons require sufficient contrast on dark backgrounds.

20.21 Responsive Behaviour

Desktop

Full experience.

iPad

Primary platform.

Desktop layout should remain almost unchanged.

Phone

Simplified.

Never hide important basketball information.

Only reduce supporting information.

20.22 Design Rules

Whenever adding a new feature ask

Can an existing component solve this?

If yes → Reuse.

Do not invent another style.

20.23 Must Never Change

DragonHub remains visually consistent.

Pages share components.

Pages share spacing.

Pages share typography.

Pages share colors.

Pages share interaction rules.

Consistency always wins.

20.24 Success Criteria

A user opening any DragonHub page should immediately recognize

- navigation,
- filters,
- search,
- drawers,
- profile cards,
- buttons,
- chips,

without learning a new interface.

The application should feel like one coherent system.

End of Chapter 20

Approved Design System Principles

- One application.
- One design language.
- One interaction model.
- One component library.
- Reuse before redesign.
- Infinite scrolling replaces pagination where appropriate.
- Drawers replace page changes.
- Chips communicate metadata only.
- Colors communicate meaning.
- Progressive loading everywhere.

- iPad becomes the reference device.
- Performance is part of the design.

Product Note

The DragonHub Design System exists to protect the product from gradually becoming inconsistent.

As the platform grows, new pages will naturally be added:

- Transfer Tracker
- Contract Center
- Medical
- Academy
- Finance
- Video Library

Every future module should first ask:

Can this be built using the existing DragonHub components?

If the answer is yes, no new design should be introduced.

This keeps DragonHub visually coherent, reduces development time, simplifies maintenance, and allows users to immediately understand new modules without learning another interface.

The design system should therefore be considered a **core architectural asset**, not simply a collection of UI components. It protects the identity of DragonHub as much as the Player Registry and Club Registry protect its data.

Chapter 21 - Data Import, Synchronization & Automation

21.1 Purpose

DragonHub should minimize manual data entry.

The system should automatically import, synchronize and connect public basketball information whenever possible.

The user should spend time scouting basketball rather than maintaining databases.

The guiding principle is:

Import once. Reuse everywhere.

21.2 Philosophy

DragonHub does not attempt to replace official data providers.

Instead, it imports verified public information and combines it with the club's internal scouting intelligence.

Public data is imported.

Internal knowledge is created.

21.3 Import Hierarchy

Every import follows exactly the same order.

Never change this hierarchy.

Competition → Teams → Club Registry → Current Rosters → Players → Statistics → Fixtures → Reports → Timeline

This hierarchy guarantees consistency across the platform.

21.4 Competition Import

The Competition Registry is always imported first.

Competition contains:

- Official Name
- Aliases
- Country
- Age Category
- Season
- Logo
- Official Website

CompetitionID becomes available before importing teams.

21.5 Team Import

Teams are imported from the competition.

Every imported team is matched against the Club Registry.

Matching order:

1. Exact Match
2. Alias Match
3. Fuzzy Match
4. Manual Confirmation

Only after ClubID is known should the import continue.

21.6 Club Registry Matching ★★★★★

Every imported club references Club Registry.

Never compare clubs using plain text.

Examples

BC Vienna

Vienna

Basketball Club Vienna → One ClubID

Everything else uses that ClubID.

21.7 Roster Import

Once ClubID exists:

Automatically import

Current Season Roster

Every player receives:

PlayerID

ClubID

CompetitionID

Season

Roster Position

No manual player importing.

21.8 Tournament Workflow

Tournament import should work automatically.

Tournament → Import Teams → Club Registry → Current Rosters → Players → Tournament Workspace Ready

The user should never manually search for players after importing teams.

21.9 Fixture Import

Fixtures are imported after teams.

Priority

Club teams → Watchlist → Review Queue → Shortlist

DragonHub should not track fixtures for every player in the database.

Only players relevant to scouting workflows.

21.10 Statistics Import

Statistics follow the agreed refresh schedule.

International tournaments

Refresh daily.

Major competitions

EuroLeague

EuroCup

ABA

BCL

ACB

BBL

LNB

Refresh every 3-4 days.

Other competitions

Weekly.

Every statistics page displays

Source → Last Updated → Refresh Schedule → Manual Refresh (Admin)

21.11 Profile Images

Whenever importing players

Attempt to import

Profile Photo

If unavailable → Use initials.

Never display both.

Future imports should automatically replace initials when a profile image becomes available.

21.12 Automatic Signals

Signals are recalculated after every import.

Examples

Coming out of College

Rookie in Europe

Breakout Season

First Overseas Season

National Team Debut

Signals should never require manual maintenance.

21.13 Timeline Updates

Every successful import may create Timeline entries.

Examples

Club changed
Competition changed
Roster updated
Statistics updated
Report created
Observation added
Timeline remains chronological.

21.14 Duplicate Prevention

DragonHub should actively prevent duplicates.

Examples

Players

Clubs

Competitions

Reports

Every import attempts to reuse existing objects before creating new ones.

21.15 Manual Overrides

Administrators may override

Club matches

Competition matches

Player matches

Statistics

Profile images

Overrides remain stored.

Future imports remember them.

21.16 Background Jobs

Examples

Roster Updates

Statistics Updates

Fixture Updates

Logo Updates

Profile Images

Signal Engine

Background jobs should not interrupt the user.

21.17 Failure Handling

Imports should never silently fail.

Instead display

Roster missing

Club not matched

Statistics unavailable

Fixture unavailable

Provide one-click actions for administrators.

21.18 Performance

Imports should happen asynchronously.

Users should continue working while synchronization completes.

Never lock the interface during imports.

21.19 Must Never Change

Imports always follow

Competition → Club → Roster → Players

Everything references IDs.

No manual player imports after rosters exist.

Duplicate prevention always runs before object creation.

21.20 Success Criteria

After importing a competition,

DragonHub should already know:

- participating clubs,
- current rosters,
- player profiles,
- player photos,
- fixtures,
- statistics,
- competition relationships.

The user should be able to start scouting immediately.

End of Chapter 21

Approved Import Principles

- Competition first.
- Club Registry before Rosters.
- Teams imported before Players.
- Automatic roster linking.
- Statistics follow scheduled refreshes.
- Profile images replace initials automatically.
- Automatic signals recalculate after imports.
- Duplicate prevention is mandatory.
- Background synchronization should never interrupt scouting.
- Manual overrides become permanent knowledge.

Product Note

Data quality is one of DragonHub's most important competitive advantages.

A beautiful interface is only valuable if the underlying information is reliable.

Therefore, every import should prioritize:

1. Correct relationships.
2. Duplicate prevention.
3. Automatic linking.
4. Transparency.
5. Minimal manual work.

Once these principles are in place, adding new competitions, leagues or tournaments becomes straightforward because every import follows the same pipeline.

Chapter 22 - People, Roles & Permissions

22.1 Purpose

DragonHub is designed to serve multiple departments within a basketball organization.

Every user should only see the information required for their work.

The interface should adapt to the user's role.

Users should never be overwhelmed by features they cannot use.

22.2 Philosophy

Permissions should simplify the application.

Not restrict it.

A Youth Coach should not feel like features have been removed.

Instead, DragonHub should feel like it was built specifically for youth coaching.

The same principle applies to scouts, administrators and front office staff.

22.3 User Roles

DragonHub currently supports the following roles.

Administrator

Complete system access.

Responsible for:

- System settings
- User management
- Registries
- Imports
- Reports
- Events
- Databases
- Calendar
- Dashboard
- Documentation

Administrator sees every module.

Professional Scout

Responsible for

- Events
- Tournament Workspace
- Scouting Matchup
- Reports
- Watchlist
- Review Queue

- Shortlist
- Pro Database
- Team List
- Free Agents

Professional scouts do not require administrative tools.

Youth Scout

Focus

Youth Database

KZS Youth Stats

Events

Tournament Workspace

Reports

Youth Watchlist

Youth scouting should remain independent from professional recruitment.

Coach

Focus

Calendar

Games

Roster

Reports

Players

Coaches do not require scouting management tools.

Youth Coach

One of the most important roles.

Visible modules

Dashboard

Calendar

Events (Youth only)

Youth Database

KZS Youth Stats

Reports

Roster

Player Profiles

Hidden

Professional Events

Professional Watchlists

Free Agents

Professional Scouting Matchup

Everything unrelated to youth basketball.

Front Office

Focus

Shortlist

Reports

Player Profiles

Contracts (future)

Recruitment

Front Office should not see scouting administration.

22.4 Permission Philosophy

Permissions should never be hardcoded into pages.

Every page should declare:

Visible To

Administrator

Professional Scout

Youth Scout

Coach

Youth Coach

Front Office

The navigation is generated automatically.

22.5 Module Visibility

Example

Dashboard → Everyone

Calendar → Everyone

Events → Everyone

Filtered by permissions.

Free Agents → Administrator

Professional Scout

Front Office

KZS Youth Stats → Administrator

Youth Coach

Youth Scout

Professional Scout (optional)

Scouting Matchup → Administrator

Professional Scout

Tournament Workspace → Professional Scout

Youth Scout

Administrator

Review Queue → Professional Scout

Administrator

Shortlist → Administrator

Professional Scout

Front Office

22.6 Data Visibility

Permissions also affect data.

Example

Youth Coach → Events

Only youth tournaments.

Professional tournaments remain hidden.

Front Office → Reports

Only reports shared with Front Office.

Coach → Reports

Only reports connected to his team.

22.7 Sharing

Every report supports visibility.

Private

Author only

Club Staff

Specific Users

Everyone

Reports should never rely only on roles.

Sharing remains flexible.

22.8 Notifications

Notifications should also respect permissions.

Examples

Administrator

User requests access

Import failed

Background job failed

Scout

Tournament starts tomorrow

Watchlist player plays today

New report shared

Coach

Practice updated

Game changed

Roster updated

22.9 User Profiles

Every user profile contains

Photo

Name

Role

Club

Department

Contact

Personal Shortcuts

Saved Views

Recent Activity

Users should feel like DragonHub remembers how they work.

22.10 Theme

Theme is shared.

If DragonHub uses

Dark Theme → Every module uses

Dark Theme.

The same applies to Light Theme.

The application should never switch themes unexpectedly when opening another module.

22.11 Must Never Change

Permissions should simplify the interface.

Users should only see relevant information.

Navigation should automatically adapt to roles.

Theme should remain consistent throughout the platform.

Reports remain individually shareable regardless of user role.

22.12 Success Criteria

A new user should sign in and immediately feel that DragonHub was built for their specific role.

They should never need to hide irrelevant tools or search through features they cannot use.

The application should naturally guide them toward the workflows that matter for their responsibilities.

End of Chapter 22

Approved Permission Principles

- One application, many tailored experiences.
- Navigation generated from permissions.
- Roles determine visibility, not functionality.
- Reports support individual sharing.
- Youth and Professional workflows remain separated.
- Theme remains synchronized across every module.
- Users should see only what helps them perform their job.

Product Note

Permissions are not a security feature alone - they are a **user experience feature**.

The goal is not to hide functionality.

The goal is to remove distractions.

A Youth Coach should never feel like they are using a restricted version of DragonHub.

They should feel like DragonHub was specifically designed for youth coaching.

The same principle applies to every role.

This role-based experience should remain one of DragonHub's defining usability principles as the platform grows.

Chapter 23 - DragonHub Guide, Onboarding & Learning

23.1 Purpose

The DragonHub Guide is the integrated learning system of DragonHub.

Its purpose is to teach users how to use the platform without requiring external documentation.

The Guide should answer one question:

How do I complete my job inside DragonHub?

The Guide is not intended to explain every button.

It explains workflows.

23.2 Philosophy

DragonHub should teach users visually.

Not through long documentation.

Every guide should answer:

- What is this module?
- Why does it exist?
- When should I use it?
- What happens next?

The Guide should focus on basketball workflows rather than software features.

23.3 Naming

Approved name

DragonHub Guide

Do not use

Academy

Documentation

Knowledge Base

Tutorials

The term **Academy** is intentionally avoided because inside basketball it refers to youth development.

23.4 Structure

DragonHub Guide consists of five sections.

Getting Started

Planning

Scouting

Databases

Administration

Every module belongs to one section.

23.5 Learning Philosophy

Every guide follows the same structure.

Purpose → Overview → Screenshot → Key Features → Best Practices → Related Modules → FAQ

Every guide should require less than five minutes to read.

23.6 Getting Started

The first experience after creating an account.

Topics

Welcome

Navigation

Search

Dashboard

Calendar

Events

Reports

Role overview

Nothing advanced.

23.7 Visual Guides

The Guide should rely primarily on annotated screenshots.

Every page contains

Large Screenshot → Callouts → Short explanation

Long paragraphs should be avoided.

23.8 Screenshot Philosophy

Every screenshot should answer one idea.

Good

Dashboard → "This widget displays the next club game."

Bad

One screenshot explaining ten unrelated features.

Keep explanations focused.

23.9 Search

The Guide supports global search.

Searching

Tournament → Returns

Tournament Workspace

Tournament Reports

Events

Player Timeline

Related content appears together.

23.10 Context Awareness ★★★★★

Every page inside DragonHub should open the relevant guide.

Example

User opens

Tournament Workspace → Clicks

? → DragonHub Guide → Tournament Workspace

Not page one.

Not homepage.

Exactly the page being used.

23.11 First-time Walkthrough

Every module supports one optional onboarding.

Example

First time opening

Reports → "Would you like a quick walkthrough?"

Yes → Highlight UI → Done

Never shown again.

23.12 Keyboard Shortcuts

Keyboard Shortcuts receive their own section.

Do not mix them with other documentation.

Structure

General

Navigation

Scouting

Reports

Calendar

Administration

Support search.

23.13 FAQ

FAQ is organized by module.

Not alphabetically.

Examples

Calendar

Events

Reports

Tournament Workspace

Player Database

Watchlist

Settings

Every FAQ belongs to one module.

23.14 Role Guides

The Guide adapts to user roles.

Youth Coach → Only Youth modules.

Professional Scout → Professional workflows.

Administrator → Everything.

Users should never see guides for modules they cannot access.

23.15 Related Guides

Every guide recommends the next logical workflow.

Example

Tournament Workspace → Player Reports → Watchlist → Review Queue → Shortlist

Learning should follow the same workflow as the application.

23.16 Future Updates

The Guide should automatically update with new screenshots after major redesigns.

Avoid maintaining multiple outdated versions.

23.17 Must Never Change

The Guide teaches workflows.

Not software menus.

Screenshots remain the primary teaching method.

Context-aware help remains the default.

Users never start reading from page one when they are already inside a module.

23.18 Success Criteria

A completely new staff member should be able to learn DragonHub without external training.

Opening a module and clicking

?

should immediately explain:

- Why this module exists.
- How to use it.
- What happens next.

The Guide should become part of the product rather than a separate manual.

End of Chapter 23

Approved DragonHub Guide Principles

- Official name: **DragonHub Guide**.
- Workflow-first learning.
- Screenshot-first documentation.
- Context-aware help.
- One onboarding walkthrough per module.
- Keyboard shortcuts separated into their own section.
- FAQ organized by module.
- Role-aware documentation.
- Every guide ends with the next recommended workflow.

Product Note

The DragonHub Guide is **not documentation added after development**.

It is considered part of the product itself.

Every new module should ship with:

- a visual guide,
- annotated screenshots,
- workflow explanation,
- best practices,
- FAQs,
- and related modules.

The objective is that new users become productive within minutes, while experienced users can quickly access contextual help without leaving their current workflow.

This philosophy should remain unchanged as DragonHub grows.

Chapter 24 - Engineering Standards, Performance & Quality Assurance

24.1 Purpose

DragonHub is expected to become a platform used daily by basketball staff.

Performance, consistency and reliability are therefore product features.

Every new feature must satisfy the engineering standards described in this chapter before it is considered complete.

24.2 Philosophy

A feature is **not finished** when it works.

A feature is finished when it is:

- Fast
- Reliable
- Consistent
- Maintainable
- Tested
- Integrated with DragonHub

Engineering quality is part of the user experience.

24.3 Performance Philosophy

DragonHub should always feel like a native application.

Users should never wait for information that is not immediately required.

Priority:

Structure → Names → Interaction → Images → Statistics → Secondary Metadata

The application must always remain usable while additional data is loading.

24.4 Progressive Rendering

Every page follows the same rendering order.

Approved sequence

Layout → Content → Profile Photos → Logos → Statistics → Reports → Additional Information

Never wait for the slowest request before rendering the page.

24.5 Image Loading

Profile Photos

Club Logos

Competition Logos

Flags

must all follow the same rule.

If available → Display image

If unavailable → Display placeholder

Never display:

Photo

+

Initials

at the same time.

24.6 Local Caching

Approved cache

Club Logos

Player Photos

Competition Logos

Flags

Frequently used metadata

Never request identical assets repeatedly.

24.7 Statistics Refresh

Approved refresh schedule

International tournaments → Daily

Major competitions → Every 3-4 days

Domestic leagues → Weekly

Admin → Manual Refresh

Every statistics page displays

Source

Last Updated

Refresh Schedule

24.8 Infinite Scroll

Large databases

must use

Infinite Scroll.

Approved modules

Player Database

Youth Database

Team List

Free Agents

Watchlist

Review Queue

Avoid pagination unless technically required.

24.9 Search Standards

Every search behaves identically.

Supports

Autocomplete

Aliases

Fuzzy matching

Instant filtering

No enormous dropdowns.

Search should always be preferred over scrolling.

24.10 Component Reuse

Never redesign existing components.

Examples

Buttons

Cards

Drawers

Chips

Search

Filters

Saved Views

Tables

Reuse first.

Create new only if absolutely necessary.

24.11 Drawers

Player Profile

Club Profile

Statistics

Reports

Timeline

Compare

All open as drawers.

The current page always remains visible.

Users never lose context.

24.12 Error Handling

DragonHub never silently fails.

Instead display

Club not linked

Roster missing

Statistics unavailable

Competition not matched

Import failed

Provide a clear explanation and recovery action.

24.13 Missing Data

Missing data is not an error.

Examples

No profile photo → Show initials

No statistics → Display

"No statistics available"

Never leave empty areas.

24.14 Loading Indicators

Skeleton loading is preferred.

Avoid

Large spinners

Blocking screens

Loading overlays

Users should always feel progress.

24.15 QA Checklist

Every module should be verified before release.

Functionality

- Does it work?

Performance

- Does it load quickly?

Consistency

- Does it follow DragonHub design?

Relationships

- Are PlayerID, ClubID and CompetitionID respected?

Mobile

- Does it work on iPad?

Dark Mode

- Are buttons readable?

Accessibility

- Keyboard navigation
- Contrast
- Touch targets

24.16 Regression Testing

Whenever one module changes,
verify related modules.

Examples

Club Registry → Tournament Workspace → Scouting Matchup → Team List → Events

Everything connected should continue working.

24.17 Coding Standards

Every new module should

Reuse components.

Reuse registries.

Reuse relationships.

Avoid duplicate logic.

Avoid duplicate queries.

Keep responsibilities separated.

24.18 Product QA

Before releasing any feature ask:

Does this improve the basketball workflow?

Does this duplicate another feature?

Does it follow the Product Specification?

Does it introduce unnecessary clicks?

Would a professional scout understand it immediately?

If the answer is no,

the feature requires another iteration.

24.19 Must Never Change

Performance is part of the product.

Reuse before redesign.

Progressive rendering everywhere.

Never duplicate data.

Never duplicate UI components.

Never introduce inconsistent interaction patterns.

24.20 Success Criteria

DragonHub should feel:

Fast

Reliable

Consistent

Predictable

Professional

A user should never think:

"This page works differently."

Every module should behave like part of one application.

End of Chapter 24

Approved Engineering Principles

- Performance is a product feature.
- Progressive rendering everywhere.
- Infinite scroll replaces pagination.
- Local caching for frequently used assets.
- One interaction model across every module.
- Reuse components before creating new ones.
- Skeleton loading preferred.
- Every change requires regression testing.
- QA includes workflow validation, not only bug testing.

Product Note

The long-term success of DragonHub will depend less on adding new features and more on preserving **consistency**.

Every month new ideas will appear:

- AI assistants
- Transfer Tracker
- Contract Center
- Medical
- Financial Planning
- Academy Management
- Video Analysis

Before building any of them, the development team should first ask:

Can this be implemented using the existing DragonHub architecture, registries, design system and workflows?

If the answer is yes, the platform remains coherent.

If every new feature invents its own UI, data model or workflow, DragonHub will eventually become fragmented.

The purpose of this chapter is therefore to protect the product from technical debt, inconsistent design and workflow duplication. It should be considered mandatory reading before implementing any significant new feature or redesign.

Chapter 25 - Product Roadmap & Long-term Vision

25.1 Purpose

DragonHub is not intended to become a larger basketball database.

Its purpose is to become the **operating system of a professional basketball department**.

Every future feature should strengthen that vision.

The platform should never become a collection of disconnected tools.

25.2 Long-term Vision

DragonHub should eventually support every major basketball department workflow.

Planning → Scouting → Recruitment → Player Development → Knowledge Management → Decision Support

Everything should happen inside one application.

25.3 Product Identity

DragonHub is **not**

- RealGM
- Eurobasket
- Flashscore
- Sofascore

Those websites provide public basketball information.

DragonHub provides something they cannot:

The club's own basketball intelligence.

DragonHub should always remain focused on creating competitive advantage through internal knowledge.

25.4 Future Architecture

Eventually there should no longer be

DragonHub → Pro Database → Youth Database → KZS

Instead

DragonHub
 Players
 Teams
 Competitions
 Reports
 Scouting
 Planning
 Administration

The databases become modules rather than separate applications.

25.5 Native Modules

Long-term objective

Remove the feeling of embedded websites.

Every module should share

Navigation

Search

Design System

Player Registry

Club Registry

Competition Registry

Permissions

Theme

Everything should feel native.

25.6 Institutional Memory ★★★★★

DragonHub should become the permanent memory of the basketball department.

Every observation remains valuable forever.

Example

Player observed → Age 14 → Youth Database → Professional career → Recruitment → Retirement → Historical reports still available

Nothing should ever be lost.

25.7 Artificial Intelligence

Artificial Intelligence should support scouts.

Never replace them.

Future AI features

Automatic report drafts

Scout Summary suggestions

Timeline summaries

Duplicate detection

Player comparisons

Market recommendations

Data quality warnings

AI assists.

Scouts decide.

25.8 Future Modules

Possible future modules

Transfer Tracker

Contract Center

Medical

Academy

Budget Planning

Travel Planning

Video Library

Opponent Preparation

Draft Board

Communication Center

Every future module should follow the existing DragonHub Design System.

25.9 Club Profiles

Future Club Profiles may include

History

Coach

Roster

Games

Reports

Prospects

Transfers

Everything already exists through Club Registry.

25.10 Competition Profiles

Competition pages

Standings

Fixtures

Statistics

Teams

Reports

Timeline

Tournament history

Everything references Competition Registry.

25.11 Timeline Intelligence

The Timeline Engine may eventually generate insights.

Examples

Player not observed for 140 days.

Player improved significantly.

Club changed coach.

Watchlist inactive.

Everything remains suggestion only.

25.12 Statistics Evolution

Statistics remain supporting information.

DragonHub should never attempt to become a live statistics provider.

Future improvements

Better sources

Better refresh

Advanced metrics

Historical comparisons

Never at the expense of scouting.

25.13 Mobile Strategy

Primary device

iPad

Secondary

Desktop

Third

Phone

DragonHub should remain optimized for professional scouting on an iPad with Magic Keyboard.

25.14 Product Growth

Every new feature should answer

Does it improve basketball decisions?

If not

It probably does not belong inside DragonHub.

Avoid feature bloat.

Protect simplicity.

25.15 Development Priorities

Priority order

1.

Data Quality → 2.

Workflow → 3.

Performance → 4.

Automation → 5.

Artificial Intelligence → 6.

Visual Polish

Good data always creates better software than beautiful interfaces with unreliable information.

25.16 Product Principles

DragonHub should always remain

Fast

Professional

Minimal

Connected

Reliable

Predictable

Everything should reinforce those principles.

25.17 What DragonHub Should Never Become

DragonHub should never become

A statistics website.

A social network.

A news portal.

A general CRM.

A document storage system.

A messaging application.

Every feature should support basketball operations.

25.18 Definition of Success

DragonHub succeeds when

Scouts spend less time managing information

and more time scouting basketball.

Everything else supports this objective.

25.19 Final Product Principles

DragonHub is built around five permanent principles.

1.

Basketball before software.

Technology exists to improve basketball decisions.

2.

Write once.

Reuse everywhere.

No duplicate work.

3.

Everything is connected.

Players.

Clubs.

Competitions.

Reports.

Games.

Events.

Timeline.

Everything.

4.

Scouting knowledge is more valuable than statistics.

Public data supports.

Internal knowledge creates competitive advantage.

5.

Consistency over complexity.

One interaction model.

One design system.

One architecture.

One product.

End of Product Specification

DragonHub Product Mission

DragonHub exists to become the complete operating system of a basketball organization.

Not by replacing public basketball information,

but by organizing everything the organization learns about the game.

Every observation.

Every report.

Every player.

Every tournament.

Every decision.

Everything connected.

Everything searchable.

Everything reusable.

Everything preserved.

The goal is not simply to build better scouting software.

The goal is to build the **institutional basketball memory** of the club.

Years from now, a scout should be able to open any player and immediately understand not only who that player is today, but every important thing the organization has ever learned about him.

That continuity of knowledge is DragonHub's greatest competitive advantage.

Chapter 26 - Basketball Operations Workflow

26.1 Purpose

DragonHub is not a collection of software modules.

It is a basketball workflow.

This chapter describes how DragonHub should be used throughout an entire season.

Every module supports one stage of that workflow.

26.2 Philosophy

A scout should never ask

"Where do I click next?"

The application should naturally guide the workflow.

Every completed step should suggest the next one.

DragonHub exists to remove administrative work so scouts can focus on basketball.

26.3 Professional Scouting Workflow

Example

Need a new point guard. → Open Player Database. → Search. → Filters. → Player Profile. → Watchlist. → Scout Game. → Scouting Matchup. → Player Report. → Review Queue. → Shortlist. → Recruitment.

Everything happens naturally.

26.4 Youth Scouting Workflow

Example

U16 Tournament. → Events. → Tournament. → Import Teams. → Club Registry. → Rosters. → Tournament Workspace. → Observations. → Youth Database. → Watchlist. → Player Report. → Timeline. → Promotion to Pro Database.

26.5 Domestic Scouting Workflow

Example

KZS weekend. → KZS Youth Stats. → Game. → Game Notebook. → Reports. → Watchlist. → Youth Database.

26.6 Live Game Workflow ★★★★★

Game starts. → Scouting Matchup. → Select player. → Observe. → Write notes. → Switch player. → Observe. → Save. → Timeline updates automatically.

No additional administration.

26.7 Tournament Workflow

Tournament begins. → Import Teams. → Automatic Rosters. → Tournament Workspace. → Select Player. → Observation. → Next Player. → Generate Reports. → Player Timeline. → Watchlist.

26.8 Recruitment Workflow

Need new Center. → Player Database. → Watchlist. → Review Queue. → Shortlist. → Compare. → Recruitment Meeting. → Decision.

26.9 Daily Workflow

Morning. → Dashboard. → Calendar. → Today's Games. → Watchlist. → Review Queue. → Events. → Scouting. → Reports.

End.

The Dashboard becomes the operational starting point every day.

26.10 Weekly Workflow

Monday

Plan week.

Tuesday

Reports.

Wednesday

Scouting.

Thursday

Player meetings.

Friday

Preparation.

Weekend

Live scouting.

Everything naturally supported by DragonHub.

26.11 Seasonal Workflow

Offseason

Market.

Free Agents.

Recruitment.

Preseason

Roster building.

Preparation.

Season

Scouting.

Reports.

Timeline.

Review Queue.

Youth season

Development.

Tournaments.

Promotion.

Every period uses different modules while remaining inside one platform.

26.12 Staff Collaboration

DragonHub supports different departments.

Scouts → Observations.

Coaches → Calendar.

Games.

Front Office → Recruitment.

Administrator → Everything.

Information flows naturally between departments.

26.13 Knowledge Flow

Nothing should remain isolated.

Example

Observation → Timeline → Report → Watchlist → Review Queue → Shortlist → Recruitment

Every observation continues creating value.

26.14 Decision Philosophy

DragonHub supports decisions.

It does not replace them.

The platform should present:

Facts.

Reports.

Observations.

Statistics.

Comparisons.

The basketball department makes the final decision.

26.15 Success Criteria

At the end of every season DragonHub should contain

Every observation.

Every report.

Every tournament.

Every player.

Every recruitment decision.

Nothing should exist outside DragonHub.

26.16 Must Never Change

DragonHub follows basketball workflows.

Not software workflows.

The application should always feel like

Basketball → Software

Never

Software → Basketball.

End of Chapter 26

Approved Basketball Workflow Principles

- Dashboard starts every day.
- Calendar manages club operations.
- Events manage scouting opportunities.
- Tournament Workspace manages tournaments.
- Scouting Matchup manages live scouting.
- Reports preserve knowledge.
- Watchlist monitors players.
- Review Queue organizes work.
- Shortlist supports recruitment.
- Everything eventually returns to the Player Timeline.

Final Product Statement

DragonHub is not simply software.

It is the **digital basketball department**.

Every screen, every workflow and every feature exists for one purpose:

To help basketball professionals spend less time managing information and more time understanding players, teams and the game itself.

The platform should quietly organize the club's knowledge in the background while allowing scouts, coaches and decision-makers to focus on what humans do best - evaluating basketball.

Chapter 27 - Product Constitution (Non-Negotiable Rules)

27.1 Purpose

This chapter defines the permanent principles of DragonHub.

Unlike the previous chapters, these rules are **not recommendations**.

They are product decisions.

Future development should adapt to these rules.

The rules should not adapt to future development.

Rule 1

DragonHub is a Basketball Operations Platform.

It is **not**

- a statistics website
- a CRM
- a document repository
- a news portal

Everything exists to improve basketball decisions.

Rule 2

Basketball comes before software.

Whenever there is a conflict between

better basketball workflow

or

better software engineering,

choose the basketball workflow.

DragonHub exists for scouts.

Not programmers.

Rule 3

Every module owns one responsibility.

Never duplicate responsibilities.

Approved ownership

Dashboard → Operations

Calendar → Club Operations

Events → Scouting Opportunities

Tournament Workspace → Tournament Scouting

Game Notebook → Live Game Scouting

Reports → Knowledge

Player Database → Discovery

Player Profile → Player Intelligence

Watchlist → Monitoring

Review Queue → Tasks

Shortlist → Recruitment

Rule 4

Write once.

Reuse everywhere.

Observations → Timeline → Reports → Player Profile → Watchlist → Review Queue → Shortlist

The same information should never be written twice.

Rule 5

One source of truth.

Player → Player Registry

Club → Club Registry

Competition → Competition Registry

Everything references IDs.

Never text.

Rule 6

Teams are imported.

Players come automatically.

Never manually import tournament players if rosters already exist.

Workflow

Competition → Club → Roster → Players

Rule 7

Statistics support scouting.

They never replace scouting.

Every statistics page displays

Source

Last Updated

Refresh Schedule

Scout Summary always appears before statistics.

Rule 8

Progressive Loading

Every page renders

Layout → Names → Interaction → Photos → Statistics → Metadata

The user should never wait before working.

Rule 9

Infinite Scroll replaces pagination.

Approved modules

Player Database

Youth Database

Team List

Watchlist

Review Queue

Free Agents

Never return to page numbers.

Rule 10

Drawers replace navigation.

Player Profile

Club Profile

Reports

Statistics

Timeline

Compare

Everything opens beside the current workspace.

The user never loses context.

Rule 11

Calendar and Events remain permanently separated.

Calendar → Our Club.

Events → Scouting.

This separation must never disappear.

Rule 12

Scouting Matchup is immutable.

Three columns.

Home Team.
Center Notes.
Away Team.
No timestamps.
No tactical timeline.
Statistics remain in drawers.
The center workspace always remains the largest.

Rule 13

Tournament Workspace replaces Tournament Reports.

Tournament Workspace is the operational scouting environment.
Reports summarize conclusions.
Tournament Workspace captures observations.

Rule 14

Scout Summary is the heart of every Player Profile.

The first question should always be
"What do WE think?"
Not
"What are his statistics?"

Rule 15

Estimated Level and Follow are different concepts.

Follow → Workflow.
Estimated Level → Basketball projection.
Never merge them.

Rule 16

Team colors communicate identity.

Vertical indicators remain the standard.
Do not return to colored team badges.

Rule 17

Search replaces scrolling.

Autocomplete.
Aliases.
Fuzzy matching.
Never build giant dropdown menus.

Rule 18

DragonHub Guide is part of the product.

Documentation ships together with features.

Never after.

Every module includes

Purpose

Workflow

Screenshots

FAQ

Related Modules

Rule 19

Every new feature answers one question.

Does this help the basketball department make better decisions?

If not,

it probably does not belong inside DragonHub.

Rule 20

Simplicity wins.

Whenever two solutions exist,

choose the simpler workflow.

Never add another click without a basketball reason.

Rule 21

Consistency wins over novelty.

Do not redesign modules because something looks newer.

Improve workflows.

Reuse components.

Protect the Design System.

Rule 22

DragonHub belongs to the basketball department.

Technology serves basketball.

Not the other way around.

Every design decision should ultimately help scouts, coaches and decision-makers understand players more effectively.

Final Product Definition

DragonHub is the institutional basketball memory of the organization.

It connects

Players.

Clubs.

Competitions.

Games.

Events.

Reports.

Observations.

Recruitment.

into one continuous basketball workflow.

The platform should quietly manage information in the background while allowing professionals to focus on evaluating basketball.

Everything else is secondary.

End of Product Specification

Version: 1.0 (Working Draft)

Status: Foundation Complete

Appendix A - Development Rules & Non-Negotiable Principles

A.1 Purpose

This appendix defines the permanent rules of DragonHub.

Unlike previous chapters, these rules are **non-negotiable**.

Developers should not redesign or reinterpret them.

Whenever implementing a feature, compare it against this appendix.

If the implementation violates one of these rules, the implementation is incorrect.

A.2 Golden Rule

DragonHub exists to help basketball professionals make better decisions.

Every new feature should answer one question:

Does this improve the basketball workflow?

If the answer is no,

the feature probably does not belong inside DragonHub.

A.3 Module Responsibilities

Every module owns exactly one responsibility.

Modules should never duplicate each other.

Module	Responsibility
Dashboard	Daily operational overview
Calendar	Club operations
Events	Scouting opportunities
Tournament Workspace	Tournament observations
Game Notebook	Live scouting
Reports	Permanent knowledge
Player Database	Discovery
Player Profile	Player intelligence
Watchlist	Monitoring
Review Queue	Scouting tasks
Shortlist	Recruitment
Team List	Club intelligence
Free Agents	Market
DragonHub Guide	Learning

Whenever two modules start doing the same job,
the design is wrong.

A.4 UI Rules

Never redesign pages independently.

Reuse existing components.

Everything should use

- identical buttons
- identical chips
- identical filters
- identical drawers
- identical search
- identical spacing

One product.

One interface.

A.5 Data Rules

Never compare

Players

Clubs

Competitions

by text.

Everything references

PlayerID

ClubID

CompetitionID

Always.

A.6 Write Once

The same information should never be entered twice.

Example

Tournament Observation → Player Timeline → Player Report → Watchlist → Review Queue

Everything updates automatically.

A.7 Navigation Rules

Text → Navigate.

Numbers → Explain.

Examples

Player Name → Profile

2 Games → Popup

24 Reports → Reports List

Never mix these interactions.

A.8 Search Rules

Search should always be preferred over scrolling.

Autocomplete everywhere.

Aliases supported everywhere.

Fuzzy matching everywhere.

Large dropdowns should gradually disappear.

A.9 Performance Rules

Never block rendering.

Always load

Structure → Names → Interaction → Images → Statistics → Metadata

Progressive loading is mandatory.

A.10 Design Rules

Never add colour without meaning.

Approved colours

Green → Actions

Blue → Estimated Level

Purple → Automatic Signals

Orange → Warnings

Red → Errors

Everything else remains neutral.

A.11 Drawer Rules

Whenever possible

use

Drawers

instead of

Page Navigation.

Examples

Player Profile

Club Profile

Statistics

Reports

Compare

Timeline

Users should never lose context.

A.12 Infinite Scroll

Every large database

must use

Infinite Scroll.

Avoid pagination.

Current approved modules

Player Database

Youth Database

Free Agents

Watchlist

Review Queue

Team List

A.13 Statistics Rules

Statistics always support scouting.

Never replace scouting.

Every stats page displays

Source → Last Updated → Refresh Schedule

Never hide this information.

A.14 Notes Rules

Notes remain simple.

No timestamps.

No tactical timeline.

No unnecessary formatting.

DragonHub records

basketball observations.

A.15 Profile Rules

Player Profile → Scout Summary first.

Statistics later.

Club Profile → Roster first.

Statistics later.

Everything begins with basketball knowledge.

A.16 Registry Rules

Player Registry

Club Registry

Competition Registry

are the three foundations of DragonHub.

No feature may bypass them.

A.17 Development Workflow

Every feature follows

Idea → Product Specification → Wireframe → UI → Implementation → QA → Release

No feature skips Product Specification.

A.18 QA Rules

Before every release ask

Does it match the Product Specification?

Does it reuse existing components?

Does it duplicate another feature?

Does it improve basketball workflow?

Does it remain fast?

Would Marko immediately understand why it exists?

Only if all answers are yes,

the feature is complete.

A.19 Things That Must Never Change

These principles are permanent.

Scouting Matchup

Three columns.

Center workspace largest.

No timestamps.

Calendar

Club operations only.

Events remain separate.

Tournament Workspace

Teams imported.

Players automatic.

Player Database

Infinite Scroll.

Side Drawer.

Player Profile

Scout Summary first.

Watchlist

Next Game.

Last Seen.

Review Queue

Task manager.

Shortlist

Recruitment.

Reports

Knowledge base.

DragonHub Guide

Workflow-first.

Club Registry

One ClubID.

Player Registry

One PlayerID.

Competition Registry

One CompetitionID.

A.20 Final Rule

Every time a developer wants to redesign something,
they must first answer:

Why is the existing design insufficient?

If the answer is

"because I think this looks nicer" → Do not redesign it.

DragonHub values

workflow

over

visual novelty.

End of Appendix A
